TMB OVERVIEW CHANGE For 2019: ADD RX LINKS FOR GEM

LATER For 2019: ODMB CHANGES TO BACKPLANE SIGNALS.

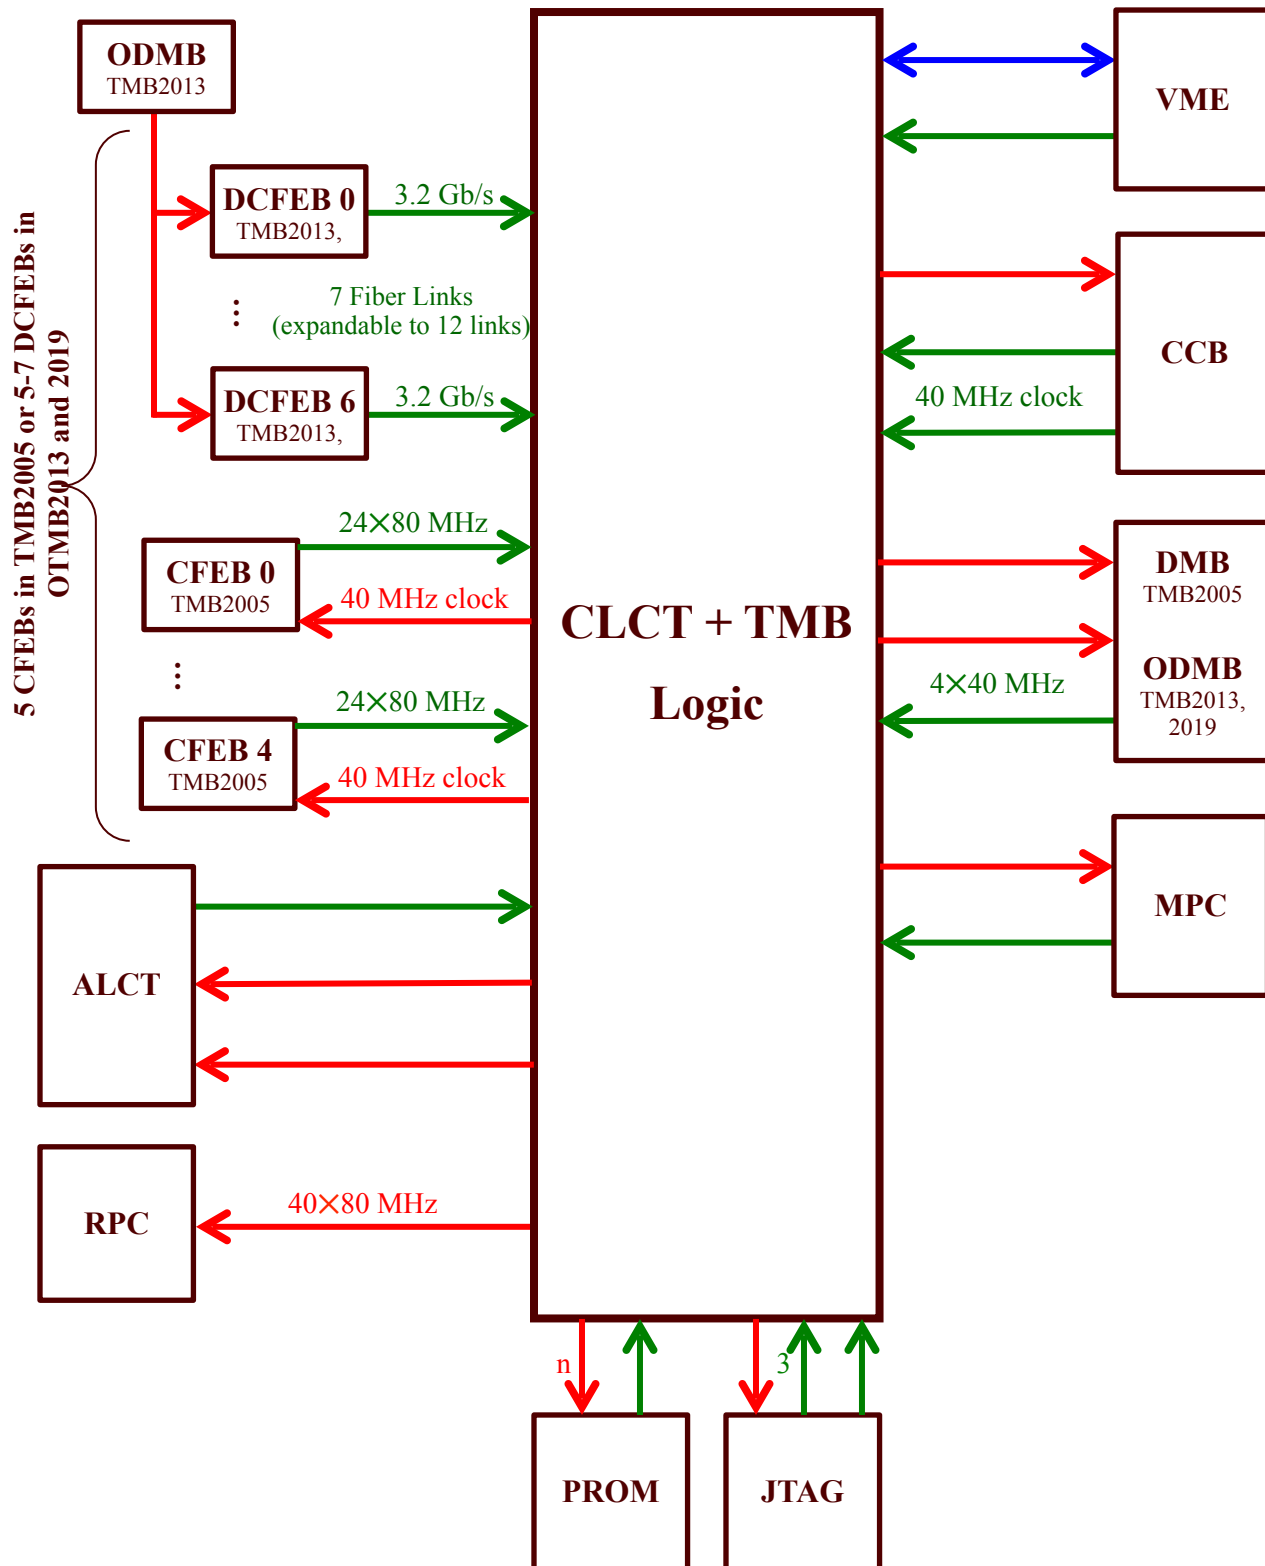

Figure 1: TMB Overview.

CLCT PROCESSING ALGORITHM CHANGE PATTERNS FOR 2019

bx -½: Latch 1st-in-time CFEB transmission

bx 0: Latch 2nd in-time CFEB transmission

- Demultiplex 1st-in-time and 2nd-in-time CFEB Triads
- Map cable-signal ordering into 5 CFEBs x 8 DiStrip Triads x 6 Layers (240 signals)
- Store CFEB Triads in Raw-hits RAM
- Multiplex CFEB Triads with internal pattern-injector RAM AND Triads with Hot Channel Mask to disable errant DiStrips
- Decode Triad start bits (240 processed in parallel)
- Triad decoder state machines run continuously to preclude missing any start bits
- Each ½-strip one-shot can fire again on the same clock cycle that the previous ½-strip pulse ends
- If a 2nd triad arrives for the same DiStrip while busy, the triad is decoded but the one-shot does not fire
- In that case, the triad-skipped counter is incremented

bx 1: Decode Triad strip bits

bx 2: Decode Triad ½-strip bits

bx 3: Fire ½-strip one-shots for 6bx (triad_persist is programmable, 6bx is the default) OR 160 ½-strips on each layer for layer-trigger mode

- Stagger correction (if stagger_hs_csc =1) shifts alternate layers by -1hs

ly0	-0hs	i.e.	hs5 → hs5	
ly1	-1hs	i.e.	hs6 → hs5	
ly2	-0hs	i.e.	hs5 → hs5	key layer ly2
ly3	-1hs	i.e.	hs6 → hs5	
ly4	-0hs	i.e.	hs5 → hs5	
ly5	-1hs	i.e.	hs6 → hs5	

- Pattern Finding: for each of 160 key ½-strips consider the 42 neighboring ½-strips (i.e. on key 5 use the following ½-strips)

hs	0123456789A	
ly0[10:0]	xxxxxkxxxxx	5+1+5 =11
ly1[7:3]	xxkxx	2+1+2 = 5
ly2[5:5]	k	0+1+0 = 1
ly3[7:3]	xxkxx	2+1+2 = 5
ly4[9:1]	xxxxkxxxxx	4+1+4 = 9
ly5[10:0]	xxxxxkxxxxx	5+1+5 =11

- For each of 160 key ½-strips, count layers with hits matching the 9 pattern templates. Pattern ID=1 is a layer-OR trigger, Pattern ID=0 is no-pattern-found

Hit pattern LUTs for 1 layer: - = don't care, xx= one hit or the other or both

Pattern	id=2	id=3	id=4	id=5	id=6	id=7	id=8	id=9	idA
Bend dir	bd=0	bd=1	bd=0	bd=1	bd=0	bd=1	bd=0	bd=1	bd=0
ly0	-----xxx xxx-----	-----xxx- -xxx-----	-----xxx- -xxx-----	-----xxx- -xxx-----	-----xxx- -xxx-----	-----xxx- -xxx-----	-----xxx- -xxx-----	-----xxx- -xxx-----	-----xxx- -xxx-----
ly1	-----xx-----xx-----	-----xx-----xx-----	-----xx-----xx-----	-----xx-----xx-----	-----xx-----xx-----	-----xx-----xx-----	-----xx-----xx-----	-----xx-----xx-----	-----xx-----xx-----
ly2 key	-----x-----x-----	-----x-----x-----	-----x-----x-----	-----x-----x-----	-----x-----x-----	-----x-----x-----	-----x-----x-----	-----x-----x-----	-----x-----x-----
ly3	---xxx-----xxx-----	---xx-----xx-----	---xx-----xx-----	---xx-----xx-----	---xx-----xx-----	---xx-----xx-----	---xx-----xx-----	---xx-----xx-----	---xx-----xx-----
ly4	-xxx-----xxx-----	-xxx-----xxx-----	-xxx-----xxx-----	-xxx-----xxx-----	-xx-----xx-----	-xx-----xx-----	-xx-----xx-----	-xx-----xx-----	-xx-----xx-----
ly5	xxx-----xxx-----	xxx-----xxx-----	xxx-----xxx-----	xxx-----xxx-----	xxx-----xxx-----	xxx-----xxx-----	xxx-----xxx-----	xxx-----xxx-----	xxx-----xxx-----
// Extent	0123456789A	0123456789A	0123456789A	0123456789A	0123456789A	0123456789A	0123456789A	0123456789A	0123456789A
// Avg.bend	- 8.0 hs	+ 8.0 hs	-6.0 hs	+6.0 hs	-4.0 hs	+4.0 hs	-2.0 hs	+2.0 hs	0.0 hs
// Min.bend	-10.0 hs	+ 6.0 hs	-8.0 hs	+4.0 hs	-6.0 hs	+2.0 hs	-4.0 hs	0.0 hs	-1.0 hs
// Max.bend	- 6.0 hs	+10.0 hs	-4.0 hs	+8.0 hs	-2.0 hs	+6.0 hs	0.0 hs	+4.0 hs	+1.0 hs

bx 4: Result for each of 160 keys is a list of 9 pattern-ID numbers (pid) [2 to A] and corresponding number of layers [0 to 6] with matching hits (nhits)

- Find the best 1-of-9 pattern ID numbers for each key by comparing nhits
- Ignore bend direction: left and right bends have equal priority (bit 0 of pid implies bend direction)
- If two pattern IDs have the same nhits, take the higher pattern ID
- A key with no matching hits, would always return pid=A and nhits=0

bx 5: Pre-trigger if any 1-of-160 keys have nhits \geq hit_thresh_pretrig and pid \geq pid_thresh_pretrig

- Construct 5-bit active-cfeb list for DMB:
- cfebs with a key that has nhits \geq hit_thresh_pretrig and pid \geq pid_thresh_pretrig
- cfebs with a key that has nhits \geq dmb_thresh_pretrig
- cfebs adjacent to a cfeb that has nhits \geq hit_thresh_pretrig and pid \geq pid_thresh_pretrig within adjfeb_dist

bx 6: Finding 1st CLCT:

- Construct 7-bit pattern quality for sorting: pat[7:0]
- pat[7:5]=nhits[2:0]
- pat[4:0]=pid[3:0]
- Ignore the bend direction bit (pid[0]), left and right bends have equal priority
- Store pat[7:0] for 160 keys for use later to find 2nd CLCT
- Start finding best 1-of-160 keys by sorting on the 6-bit number pat[7:1]
- If two keys have the same pat[7:1] take the lower key

bx 7: Find 1st CLCT:

- Finish finding best 1-of-160 keys by sorting on the 6-bit number pat[7:1]
- Store 1st CLCT info: key, pattern ID, and number of hits
- For empty events, key=0, pid=A and nhits=0. If clct_blanking=1, then key=pid=hits=0

bx 8: Finding 2nd CLCT:

- Construct list of busy keys
- Mark keys near 1st CLCT as busy from 1st key-nspace to 1st key+pspace
- If clct_sep_src=1, pspace and nspace are set equal to clct_sep_vme, typically 10hs
- If clct_sep_src=0, pspace and nspace are read from RAM and depend on the pattern ID number
- This allows two non-bending tracks | | to be closer than bending tracks / \
- Start finding best 1-of-160 keys by sorting on the 6-bit number pat[7:1]
- Skip busy keys
- If two keys have the same pat[7:1] take the lower key

bx 9: Find 2nd CLCT:

- Finish finding best 1-of-160 keys by sorting on the 6-bit number pat[7:1]
- Store 2nd CLCT info: key, pattern ID, and number of hits
- For empty events, key=11, pid=A and nhits=0. If clct_blanking=1, then key=pid=hits=0

bx 10: Drift Delay 1bx (waits for CSC drifting)

bx 11: Drift Delay 1bx

- If clct0 nhits < hit_thresh_postdrift OR pid < pid_thresh_post_drift, discard event

bx 12: Match to ALCT window 0

- If alct matches, jump to bx15 logic, latency is shortened 2bx

bx 13: Match to ALCT window 1

- If alct matches, jump to bx15 logic, latency is shortened 1bx

bx 14: Match to ALCT window 2

- If ALCT does not arrive, and clct_only mode is enabled, accept CLCT at window 2
- If ALCT does not arrive, and not in clct_only mode, discard event

bx 15: Construct two LCTs from CLCT and ALCT data

- If event has 2 CLCTs and 1 ALCT, copy 1st ALCT into 2nd ALCT position
- If event has 1 CLCT and 2 ALCTs, copy 1st CLCT into 2nd CLCT position
- Calculate LCT quality
- Multiplex mpc injector ram data

bx 16: Transmit 1st-in-time LCT frame to MPC

bx 16½: Transmit 2nd-in-time LCT frame to MPC

SIGNAL SYNCHRONIZATION

CFEB Muonic Receiver Synchronization Stages

CFEB Double Data Rate (DDR) receiver logic is designed to synchronize incoming comparator data to TMB's main clock, while minimizing CLCT trigger-path latency. It has a programmable 0-16bx delay stage to compensate for differing CFEB cable lengths.

The logic is shown schematically (Figure 2) but the actual TMB logic is written in behavioral Verilog.

U1A: Latches incoming CFEB data `din` on the *falling* edge of `clock_iob`.

- The user has already tuned the associated `cfep[n]_rxd` digital phase shifter so that `clock_iob` always latches stable data.

U1B: Latches incoming `din` on the *rising* edge of `clock_iob`.

- U1A and U1B comprise a single DDR I/O-Block flip-flop, and are only shown here separately for clarity.

U2: Latches data transferred from U1A on the *rising* edge of `clock_iob`.

- U2 now holds `din_1st-in-time` data, aligned with the *rising* edge of `clock_iob`, while
- U1B holds `din_2nd-in-time` data, also aligned with the *rising* edge of `clock_iob`.
- In non-muonic firmware, this would be the end stage, because `clock_iob` would be the same as TMB's main clock.
- In muonic firmware versions, `din_1st` and `din_2nd` still need to be synchronized to TMB's main clock. This is done by latching data on both the *rising* (positive) edge and *falling* (negative) edge of the main clock, then selecting one latch or the other with the `posneg` bit.
- If the positive edge flip-flops U11, U12 are out-of-time (creating a dead-spot in the `din` receive window) then the negedge flip-flops U3, U4 must be in-time. One set of latches, either U11, U12 or U3, U4 will always be in-time for a given phase of `clock_iob`.

U3, U4: Latch `din_1st` and `din_2nd` on the *falling* edge TMB's main `clock_1x`.

U5,U6: Select either positive edge data from U2, U1B or negative edge data from U3, U4.

U7,U8: Delay data by 1-to-16 bx, according to `delay[3:0]` from a VME register.

- Setting `address=0` for U7, U8 gives a 1bx delay, so `delay-1` is used to form the address.

U14: Subtracts 1 from `delay[3:0]` to form the shift register address for U7, U8.

U9, U10: Bypass delays U7, U8 if the delay is 0, thus giving a 0-to-16bx delay span.

U11, U12: Latch data on the *rising* edge of TMBs main `clock_1x`, and are the final synchronization stage.

ALCT Muonic Receiver Synchronization Stages

ALCT Double Data Rate (DDR) receiver logic is designed to synchronize incoming data to TMB's main clock. It uses a small number of flip-flops, and is able to fit in a single FPGA column. It uses a different technique than the CFEB sync section, and does not have a delay stage.

The logic is shown schematically (Figure 3), but the actual TMB logic is written in behavioral Verilog.

U1A: Latches incoming ALCT data `din` on the *falling* (negative) edge of `clock_iob`.

- The user has already tuned the associated `alct_rxd` digital phase shifter so that `clock_iob` always latches stable data.

U1B: Latches incoming `din` on the *rising* (positive) edge of `clock_iob`.

- U1A and U1B comprise a single DDR I/O-Block flip-flop, and are only shown here separately for clarity.

U2: Latches ALCT data transferred from U1A on the *rising* (positive) edge of `clock_iob`.

- U2 now holds `din_1st-in-time` data, aligned with the *rising* (positive) edge of `clock_iob`, while
- U1B holds `din_2nd-in-time` data, also aligned with the *rising* (positive) edge of `clock_iob`.
- In non-muonic firmware, this would be the end stage, because `clock_iob` would be the same as TMB's main clock.

U3, U4: Latch `din_1st` and `din_2nd` on either the *rising* (positive) or *falling* (negative) edge of TMB's main `clock_1x`.

- They are clocked at 2x the main clock frequency, but are enabled for only one edge direction, according to the value of the `posneg` bit.
- The edges of `clock_2x` are closely aligned to the edges of `clock_1x`.

U7:

- If `posneg=1`, U7 inverts a logic accessible copy of `clock_1x`, called `clock_lac`.
- If `posneg=0`, U7 passes `clock_lac` un-inverted.
- Because `clock_lac` is delayed by about 2ns after `clock_1x`, `posneg=1` enables U3, U4 to latch data on the edge of `clock_2x` that corresponds to the *rising* edge of `clock_1x`, and `posneg=0` enables latching on the *falling* edge.

U5, U6: Latch data on the *rising* edge of TMB's main `clock_1x`, and are the final synchronization stage.

ALCT Muonic Transmitter Synchronization Stages

ALCT Double Data Rate (DDR) transmitter logic is designed to synchronize TMB's outgoing data to the ALCT board's clock. It has a programmable 0-16bx delay stage, and a data-path multiplexer for sending test patterns to ALCT.

The logic is shown schematically (Figure 4), but the actual TMB logic is written in behavioral Verilog.

U1, U2: Select the transmitter data source, either ALCT data or the test pattern generator, according to the value of `sync_mode`.

U3,U4: Delay data by 1-to-16 bx, according to the VME-set `delay-1` (the subtractor is not shown).

U3, U4: Delay data by 1-to-16 bx, according to `delay[3:0]` from a VME register.

- Setting `address=0` for U3, U4 gives a 1bx delay, so `delay-1` is used to form the address.

U15: Subtracts 1 from `delay[3:0]` to form the shift register address for U3, U4.

U5, U6: Bypass delays U3, U4 if the delay is 0, thus giving a 0-to-16 bx delay span.

U7, U8: Latch data on the *rising* edge of TMB's main `clock_1x`, and are the final main-clock stage.

- In non-muonic firmware, this would be the end stage, because `clock_iob` would be the same as TMB's main clock.

U9, U10: Latch data on either the *rising* or *falling* edge of TMB's main `clock_1x`.

- They are clocked at 2x the main clock frequency, but are enabled for only one edge direction, according to the value of the `posneg` bit.
- The edges of `clock_2x` are closely aligned to the edges of `clock_1x`.

U14:

- If `posneg=1`, U14 inverts a logic accessible copy of `clock_1x`, called `clock_lac`.
- If `posneg=0`, U14 passes `clock_lac` un-inverted.
- Because `clock_lac` is delayed by about 2ns after `clock_1x`, `posneg=1` enables U9, U10 to latch data on the edge of `clock_2x` that corresponds to the *rising* edge of `clock_1x`, and `posneg=0` enables latching on the *falling* edge.

U12: Latches 1st-in-time data on the *rising* edge of `clock_iob`. It is a DDR I/O Block flip-flop that transmits 1st-in-time data on the *rising* edge of `clock_iob`, and 2nd-in-time on the *falling* edge.

U11: Holds 2nd-in-time data for ½ cycle while waiting for U12 to transmit 1st-in-time data.

CFEB-to-TMB: 80MHz-to-40MHz Muonic Receiver Sync Stages

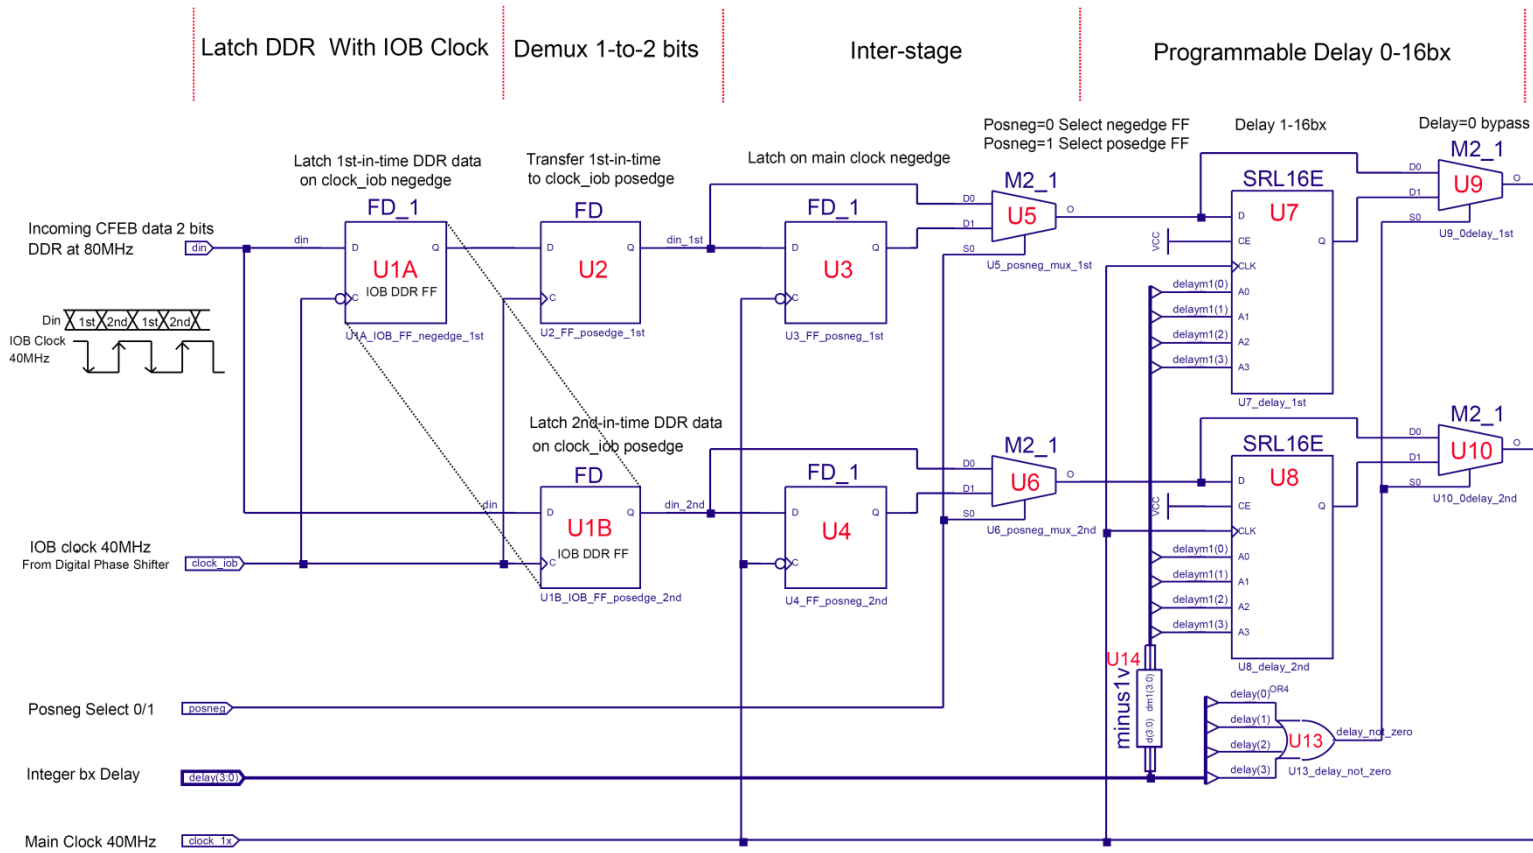

Figure 2: CFEB Muonic Receiver

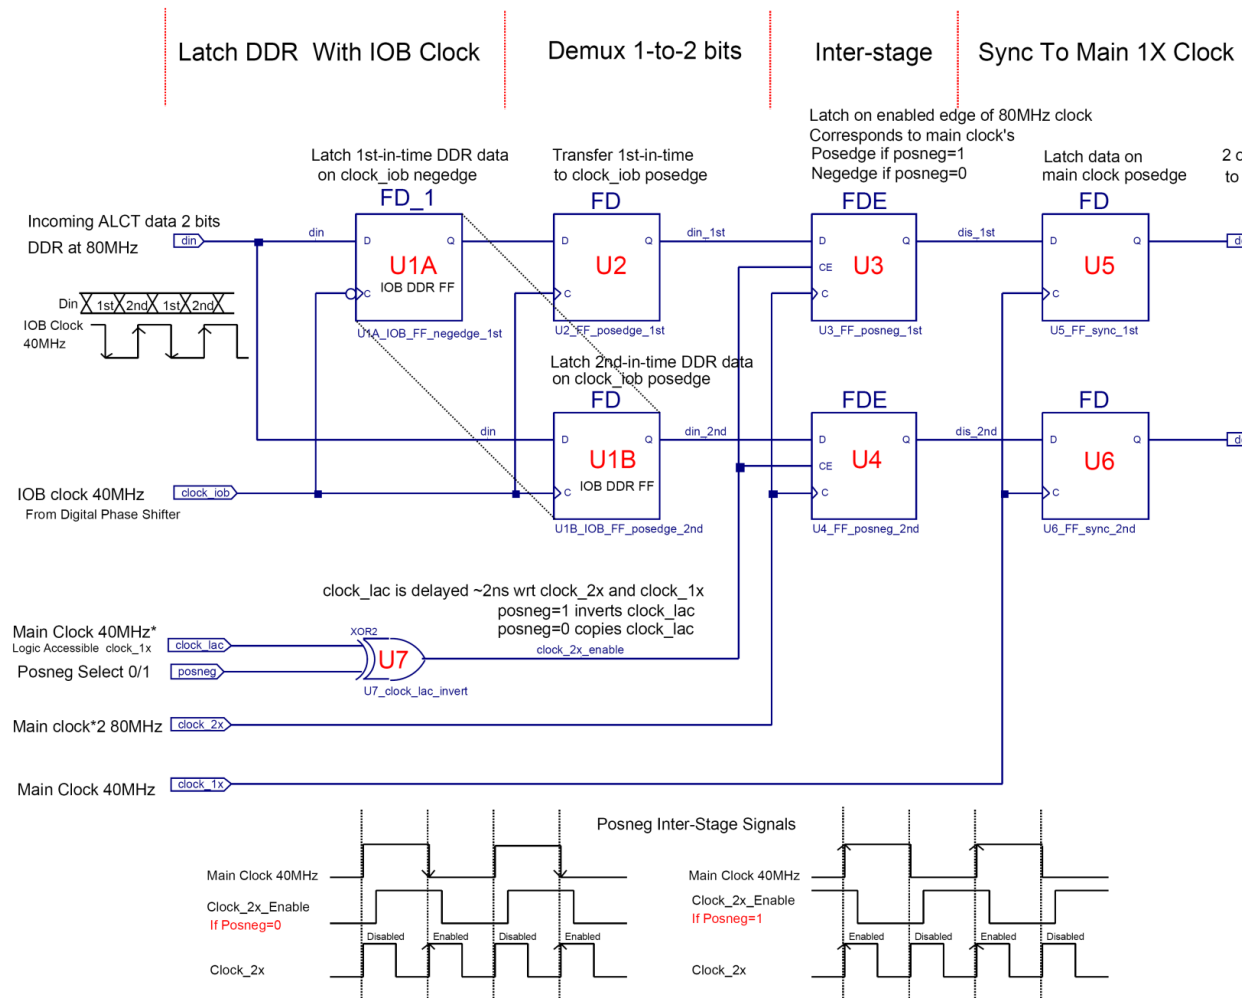

Figure 3: ALCT Muonic Receiver

TMB-to-ALCT: Transmitter Sync Stages

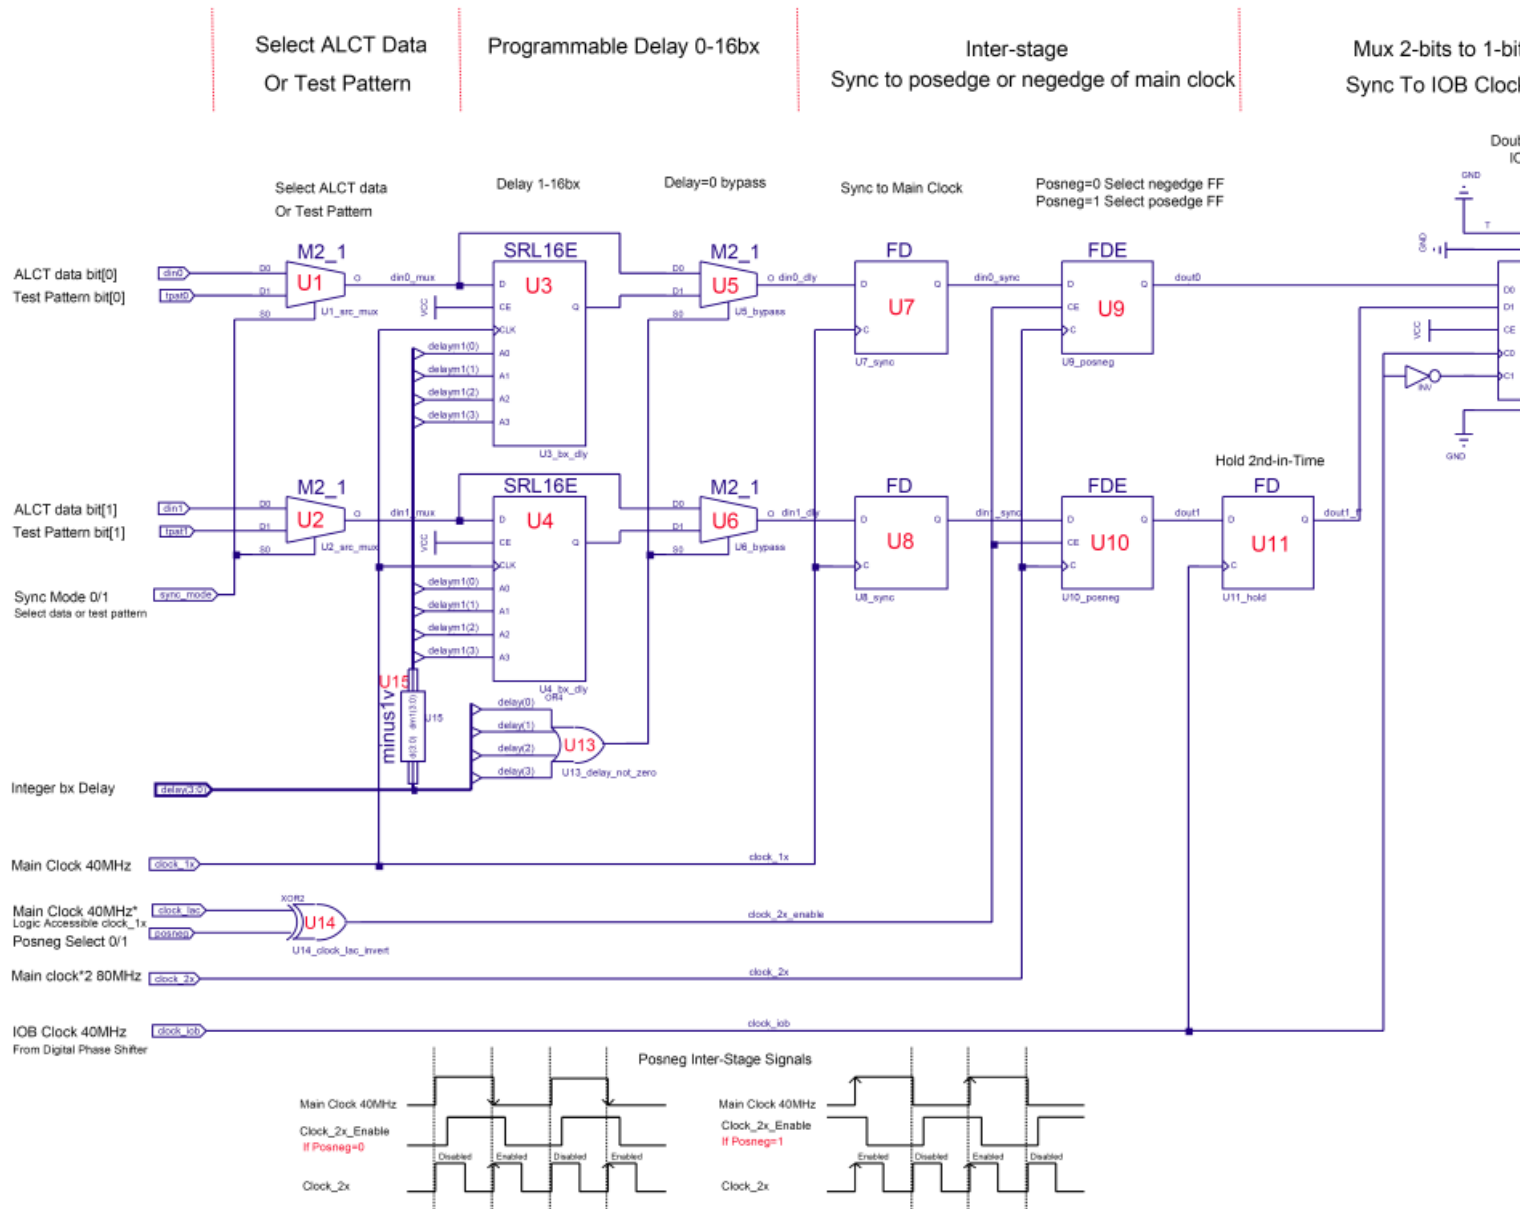

Figure 4: ALCT Muonic Transmitter

TTC SEQUENCES

Trigger State

Start/Stop Triggering Sequence:

On hard_reset go to the StopTrigger state: TMBs CLCT processing machine goes to “idle”.

On ttc_start_trigger, wait for the next BX0 (if ttc starts are allowed)

On the next ttc_bx0, resume triggering.

On ttc_stop_trigger (if ttc stops are allowed) or ttc_resync go the StopTrigger state.

Bunch Crossing Counter

Bunch Counter Reset:

On ttc_resync or ttc_bxreset, preset the BXN, and hold the count.

On the next BX0 resume counting bunch crossings.

On subsequent BX0s, check that BXN is again at the preset value, if not, set sync_error.

TMB further checks that when BXN is at the preset value, that a BX0 arrived, if not, set sync_error.

Resync

L1A Counter Reset:

On ttc_resync or ccb_evcntreset, clear L1A event counters.

Buffer Reset:

ttc_resync clears TMBs buffer-pointers, aborts any readout in progress, and returns various state machines to their idle states (a similar condition to after power-up or hard-reset).

ALCT+CLCT MATCHING ALGORITHM FOR 2019: STILL ACCURATE?

Matching Logic

LCT Duplication:

```
// Fill in missing ALCT if CLCT has 2 muons, missing CLCT if ALCT has 2 muons
wire  no_alct  = !alct0_vpf;
wire  no_clct  = !clct0_vpf;

wire  one_alct = alct0_vpf && !alct1_vpf;
wire  one_clct = clct0_vpf && !clct1_vpf;

wire  two_alct = alct0_vpf && alct1_vpf;
wire  two_clct = clct0_vpf && clct1_vpf;

wire  dupe_alct = one_alct && two_clct;
wire  dupe_clct = one_clct && two_alct;

wire  [MXALCT-1:0]  alct_dummy = clct0_real[18:17] << 11;           // Inserts clct bxn into
wire  [MXCLCT-1:0]  clct_dummy = 0;                                // frame for clct_only events

wire  [MXALCT-1:0]  alct0 = (no_alct  ) ? alct_dummy : alct0_real; // Substitute dummy alct
wire  [MXALCT-1:0]  alct1 = (dupe_alct) ? alct0_real : alct1_real;

wire  [MXCLCT-1:0]  clct0 = (no_clct  ) ? clct0_real : clct0_real; // Do not
wire  [MXCLCT-1:0]  clct1 = (dupe_clct) ? clct0_real : clct1_real;

wire  first_vpf      = alct0_vpf || clct0_vpf;                      // First muon exists
wire  second_vpf     = alct1_vpf || clct1_vpf;                      // Second muon exists
```

LCT Quality:

```
module lct_quality (ACC,A,C,A4,C4,P,CPAT,Q);
// Ports
    input ACC;      // ALCT accelerator muon bit
    input A;        // bit: ALCT was found
    input C;        // bit: CLCT was found
    input A4;       // bit (N_A>=4), where N_A=number of ALCT layers
    input C4;       // bit (N_C>=4), where N_C=number of CLCT layers
    input [3:0] P;  // 4-bit CLCT pattern number that is presently 1 for n-layer triggers,
                    // 2-10 for current patterns, 11-15 "for future expansion".
    input CPAT;     // bit for cathode .pattern trigger., i.e. (P>=2 && P<=10) at present
    output [3:0] Q; // 4-bit TMB quality output
```

MPC Format: Updated For 2019: NEW LCT-MPC FORMAT!!

```

assign mpc0_frame0[6:0]      =      alct0_key[6:0];
assign mpc0_frame0[10:7]     =      clct0_pattern[3:0]; //was clct0_bend[3:0]
assign mpc0_frame0[13:11]    =      lct0_quality[2:0] * lct0_vpf; //Check VPF requirement!!
assign mpc0_frame0[14]      =      clct0_QuarterStrip;
assign mpc0_frame0[15]      =      lct0_vpf; // EighthStrip was proposed

VME REGISTERS

Addressing Modes

TMB2005 responds to A24D16 VME addressing modes:

- Address Modifier 39₁₆, A24 non-privileged mode
- Address Modifier 3D₁₆, A24 supervisor mode

It does not respond to byte-addressing modes, so all valid addresses must be even numbers.

Base Address

TMB2005s “base address” bits A[23:19] select which TMB is being addressed by the VME crate controller. The base address is determined either by the 5 VME-backplane-slot Geographic Address bits or by the Local Address set by two on-board hexadecimal rotary switches. Shunt SH62 selects between Geographic [1-2] and Local [2-3] modes.

- A[23:19] = VME Crate Slot Geographic Address, (Slot= 2 to 21)₁₀ SH62 [1-2]
- A[23:19] = Hexadecimal Switch Address SW2x16+SW1 SH62 [2-3]

Multiple TMBs can be addressed simultaneously using a Global Address:

- A[23:19] = 26₁₀ Addresses all TMBs in parallel
- A[23:19] = 27₁₀ Address all peripheral crate modules

Boot Register

When geographic addressing is used, the S2/S1 hexadecimal switches should be set to 1Ah, which allows the hardware Boot Register to respond to the slot 26₁₀ global address.

The Boot Register responds to all even VME addresses + base between 70000h and 7FFFEh to allow block-mode VME writes.

List of Register Addresses

The addresses are hexadecimal and should be added to base.

Table 1: List of VME Register Addresses

Address	Register Name	Page	Description
70000	ADR_BOOT	27	Hardware Bootstrap Register
00	ADR_IDREG0		ID Register 0
02	ADR_IDREG1		ID Register 1
04	ADR_IDREG2		ID Register 2
06	ADR_IDREG3		ID Register 3
08	ADR_VME_STATUS		VME Status Register
0A	ADR_VME_ADR0		VME Address read-back
0C	ADR_VME_ADR1		VME Address read-back
0E	ADR_LOOPBK		Loop-back Register
10	ADR_USR_JTAG		User JTAG
12	ADR_PROM		PROM
14	ADR_DDDSM		3D3444 State Machine Register + Clock DCMs
16	ADR_DDD0		3D3444 Delay Chip 0
18	ADR_DDD1		3D3444 Delay Chip 1
1A	ADR_DDD2		3D3444 Delay Chip 2

Adr 68 ADR_SEQ_TRIG_EN Sequencer Trigger Source Enables **

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
cfeben source	cfeben 4	cfeben 3	cfeben 2	cfeben 1	cfeben 0	all cfebs active	ext trig inject	vme trig	alct ext trig en	clct ext trig en	adb ext trig en	adb ext trig en	alct*clct match trig en	alct pat trig en	clct pat trig en

Bits	Dir	Signal	Default	Description
[00]	RW	clct_pat_trig_en	1	1=Allow CLCT pattern triggers (CLCT Active FEB)
[01]	RW	alct_pat_trig_en	0	1=Allow ALCT pattern triggers (ALCT Active FEB)
[02]	RW	alct_match_trig_en	0	1=ALCT*CLCT pattern triggers
[03]	RW	adb_ext_trig_en	0	1=Allow ADB external triggers from CCB
[04]	RW	dmb_ext_trig_en	0	1=Allow DMB external triggers
[05]	RW	clct_ext_trig_en	0	1=Allow CLCT external triggers (scintillator) from CCB
[06]	RW	alct_ext_trig_en	0	1=Allow ALCT external triggers from CCB
[07]	RW	vme_ext_trig	0	1=Initiate Sequencer trigger (write 0 to recover)
[08]	RW	ext_trig_inject	0	1=Change clct_ext_trig to fire pattern injector
[09]	RW	all_cfebs_active	0	1=Make all CFEBs active when triggered
[14:10]	RW*	cfeb_en	1111 ₂	1=Enable CFEB[n] to trigger and send active_feb_flag
[15]	RW	cfeb_en_source	1	1=cfeb_en set by mask_all[4:0] in Adr 42, 0=set by 68

* normally, cfeb_en is copied from mask_all in Adr42 so that masked-off cfebs do not trigger TMB or send active feb to DMB. That prevents the CFEB pattern injector from triggering, so setting_cfeb_en_source=0, allows cfeb_en to be written independently via Adr68[14:10].

** See adr F0 [p68](#) for layer-trigger mode

USER PROM PROGRAMMING

Introduction

TMB has two on-board erasable PROMs that contain non-volatile data for modifying VME registers and for initializing JTAG chains. The PROMs are read automatically by firmware state machines after power-up or hard-reset.

Both PROMs are Xilinx XC18V256 devices, which have a capacity of 256K bits stored 1-byte wide in 32K addresses. Some late-production TMBs may have one or two XC18V512 devices, because the 256K product was discontinued by the manufacturer.

PROM contents are programmed and verified either via the front-panel JTAG connector or from the VME backplane using TMBs boot register. The data may be read out 8-wide though TMBs PROM-port register ADR_PROM (12h) or it may be read 1-bit serial via JTAG.

Register Initialization

Initialization after power-up or hard reset proceeds as follows:

- 1) FPGA loads its firmware from mezzanine PROMs (100msec)
- 2) Delay Locked Loops (DLLs) acquire lock on the 40MHz TTC clock (lock time not yet tested)
- 3) VME registers load their default values (100ns)
- 4) The VMESm state machine reads PROM 0 and writes any new data to the specified VME registers.
- 5) JTAGsm state machine reads PROM 1 and write JTAG data to the specified chains.

VME PROM-0

After TMB loads default values into its VME registers, the VMESm state machine reads PROM 0 and updates the specified VME registers with PROM data. The PROM contains a 16-word header, followed by an arbitrary number of 24-bit VME-addresses and their associated 16-bit data word, then followed by a 3-byte trailer sequence that contains the checksum and end-of-PROM marker.

The VMESm state machine expects PROM-0 data to be organized in a specific format and it may either terminate the read-process or indicate an error condition if the format is incorrect. If the BCh header-begin marker is missing, the state machine terminates reading immediately.

The 16-byte header consists of the BC “begin CLCT data” marker, a 2-byte word count, and the EC end marker. There are no restrictions on the values of the other 12 header bytes. VMESm assembles the two word-count bytes into a 16-bit number that it uses to recognize when to stop reading the PROM.

The word-count includes every PROM address between the BC and FF markers, inclusive. If there are n VME addresses to be written, the word count would be 16 header + 5n vme data + 3 trailer = $19_{10} + 5n$. A counter in `ADR_VMESM3` records the number of VME addresses what were actually written. A value of 55Aah should be written to VME address `ADR_VMESM4` to test the PROM-to-FPGA data path.

VME PROM-0 data format:

Adr	7654 3210	Hex	Description
---	---- ---- --	--	-----
0	1011 1100	BC	Begin CLCT Header Marker, if missing state machine stops
1	tttt oooo	LL	Word count [7:0] kkkk hhhh tttt oooo from BC to FF
2	kkkk hhhh	HH	Word count [15:8]
3	tttt oooo	12	Month (month/day in "hex-ascii" December 31, 2006)
4	tttt oooo	31	Day
5	tttt oooo	06	Year 2006 = kkkk hhhh tttt oooo
6	kkkk hhhh	20	Year
7	vvvv vvvv	XX	Version number = vvvv vvvv
8	xxxx xxxx	AA	Option (suggest AA to test even bits)
9	xxxx xxxx	55	Option (suggest 55 to test odd bits)
A	xxxx xxxx	XX	Option
B	xxxx xxxx	XX	Option
C	xxxx xxxx	XX	Option
D	xxxx xxxx	XX	Option
E	xxxx xxxx	XX	Option
F	1110 1100	EC	End Header Marker
10	aaaa aaaa	LL	VME adr[7:0] This 5-byte structure is repeated
11	aaaa aaaa	MM	VME adr[15:8] for every VME address that is
12	aaaa aaaa	HH	VME adr[23:16] to be modified
13	dddd dddd	LL	VME data[7:0]
14	dddd dddd	HH	VME data[15:8]
L-2	1111 1100	FC	End of CLCT VME data Marker
L-1	cccc cccc	cc	Check sum [7:0] includes addresses 0 to L-2
L	1111 1111	FF	End of PROM data Marker

If VMESm detects an error condition, status information can be read from VME address

ADR_VMESM2 (0xDE):

```

fmt_err[0] = Missing BC header-begin marker
fmt_err[1] = Missing EC header-end marker
fmt_err[2] = Missing FC data-end marker
fmt_err[3] = Missing FF prom-end marker
fmt_err[4] = Word counter overflow

```

JTAG PROM-1

After the VMESm state machine completes successful, the JTAGsm machine is started. It reads PROM-1 and writes to the JTAG chains specified by the PROM data. The PROM contains a 16-word header, followed by an arbitrary number of 3-byte Chain Blocks, then followed by a 8-byte trailer sequence that contains the tck-count, word-count, checksum and end-of-PROM marker.

Header

The JTAGsm state machine expects PROM-1 data to be organized in a specific format and it may either terminate the read-process or indicate an error condition if the format is incorrect. If the Bah header-begin marker is missing, the state machine terminates reading immediately.

The 16-byte header consists of the BA “begin ALCT data” marker and the EA end marker. The state machine skips over the next 15 bytes, so are no restrictions on the header contents.

Adr	7654 3210	Hex	Description
---	---- ----	--	-----
0	10111010	BA	Begin ALCT Marker, if “BA” missing state machine stops
1	0000aaaa	03	ALCT MSD 3 Type (288,384,672)
2	0000aaaa	08	ALCT 8
3	0000aaaa	04	ALCT LSD 4
4	0000mmmm	00	Month MSD 0 in “hex-ascii” June 9, 2008
5	0000mmmm	06	Month LSD 6
6	0000dddd	00	Day MSD 0
7	0000dddd	09	Day LSD 9
8	0000yyyy	02	Year MSD 2
9	0000yyyy	00	Year 0
A	0000yyyy	00	Year 0
B	0000yyyy	08	Year LSD 8
C	0000vvvv	01	Version number [3:0]
D	0000xxxx	00	Future use
E	0000xxxx	00	Future use
F	00101010	EA	End ALCT Header Marker

Chain Block

A Chain Block marker “Cs” signals the start of a new sequence to generate TCK,TMS, and TDI for a JTAG chain. The “s” in the “Cs” marker is the chain address SEL[3:0]. Normally, TCK will be held high after the last TMS/TDI pair is sent, unless the “C” marker is replaced by a “D” maker. After Cs, there are two more bytes specifying the number of TCK clock pulses to send to the chain.

Following the TCK count are JTAG data bytes that contain packed TMS and TDI bits for up to 4 TCKs. The number of data bytes is tck_count/4+1.

Chain Block Format [7:0]:

76543210		
1100ssss	Cs	Chain Block begin marker chain address ssss =SEL[3:0]. Cs=hold tck high, Ds= do not
tttttttt	ww	TCK count [15:8]
tttttttt	ww	TCK count [7:0]
1sisisisi	si	JTAG data [7:0], I=TDI bit, s=TMS bit, defined below

4 TCKs packed per byte format, data[7:0]:

Bit	Signal
[0]	TDI[0]
[1]	TMS[0]
[2]	TDI[1]
[3]	TMS[1]
[4]	TDI[2]
[5]	TMS[2]
[6]	TDI[3]
[7]	TMS[3]

SEL[3:0] Selects the active JTAG chain:

SEL[3:0]		
Hex	3210	Function
0	0000	ALCT Slow Control FPGA user registers
1	0001	ALCT Slow Control FPGA PROM)
2	0010	ALCT Mezzanine FPGA user registers
3	0011	ALCT Mezzanine FPGA PROMs
4	01XX	TMB Mezzanine FPGA+PROMs
8	10XX	TMB User PROMs
C	1100	TMB FPGA Monitor (for TMB self-test)
D	1101	RAT Module FPGA+PROM

Chain Block, Continued

The state machine copies the signals TMS, and TDI to the JTAG chain selected by SEL[3:0]. It automatically generates the JTAG clock TCK and also arranges for asserting the next TMS and TDI values while TCK is low.

TMB hardware pulls TCK, TMS, and TDI high for chains that are not currently selected. When changing to a new chain ID, it is recommend that the last PROM word for that chain sets the signals to a logic high.

The number of Chain Blocks is limited only by the memory capacity of the PROM. Each block begins with a Cs marker, and the last block is indicated by an “FA” marker.

Trailer

An 8-byte trailer sequence contains the total-tck-count, PROM word count, data checksum and end-of-PROM marker. The tck-count is the number of TCKs the state machine sent to all chains. The word-count includes every PROM address between the BA and FA markers, inclusive, as well as the 3 TCK-count bytes. Checksum includes every PROM address from the BA marker to the last word-count byte.

Adr	7654 3210	Hex	Description	
---	----	--	-----	
T-1	11111010	FC	End of JTAG data Marker	Also set chain address to C
T+0	tttttttt	tt	TCK Count Total [17:16]	Includes tcks sent for all chain blocks
T+1	tttttttt	tt	TCK Count Total [15:8]	
T+2	tttttttt	tt	TCK Count Total [7:0]	
T+3	wwwwwww	ww	Word Count [15:8]	Includes Adr 0 and end JTAG marker at T+2
T+4	wwwwwww	ww	Word Count [7:0]	

T+5	cccccccc	cc	Check sum [7:0]	Includes addresses 0 and T+5
T+6	11111111	FF	End of PROM data Marker	

If the tck-count, word-count or checksum are incorrect, or if the last-word marker is missing, the state machine indicates the an error by setting jsm_tck_fpga_ok=0.

TCK Throttle

The JTAGsm state machine reads header and trailer bytes from the PROM at 20MHz, then slows to 2.5MHz for processing JTAG data bytes. This results in TCK being pulsed at 10MHz (because there are 4 TCKs per byte, each 50ns high + 50ns low).

If this rate is too high for ALCT JTAG chains, the state machine can be throttled to a lower speed by setting jsm_throttle[3:0] in ADR_VMESM0 (D4h). A jsm_throttle value of 0 corresponds firing TCK at 10MHz full speed. Increasing jsm_throttle by 'n' increases the TCK period by 25ns*n, and maintains a 50% duty cycle.

State Machine Status

Automatic operation of the state machine can be verified by including TCK writes to chain address C. That chain effectively loops-back TCK, TMS and TDI to the FPGA. If at least 1 TCK transition is seen on chain C, then signal jsm_tck_fpga_ok will be a logic 1 in VME register ADR_JTAGSM0, and tck_fpga_cnt[3:0] in ADR_JTAGSM2 counts the number of TCKs. Demo software exists that converts old PROM data files to this new format and automatically inserts a C-chain Block if there is not one already.

JTAG PROM-1 data format Example:

Adr	7654 3210	Hex	Description

```

Miniscope

TMB contains a smaller version of the main digital scope that is intended to be included in the DMB readout stream by default. The minscope displays a time history of ALCTs, CLCTs, and L1As that helps reproduce TMB behavior offline.

Miniscope data is written continuously to Block RAM, in the same fashion as CFEB raw hits are stored.

When there is a CLCT pre-trigger, miniscope data starts at `fifo_pretrig_mini` time bins before the pre-trigger occurred. If there is no CLCT pre-trigger, miniscope data can still be read out in an L1A-only event, using the L1A look-back mode.

The miniscope is enabled by setting:

```
0x10C [00]    mini_read_enable = 1  Turn miniscope on
0x10C [01]    mini_tbins_test  = 1  Turn debug mode off
0x10C [02]    mini_tbins_word  = 1  Insert tbins and pre-trig tbins settings in 1st word
0x10C [07:03] fifo_tbins_mini  = 22 Number of time bins to read out, must be a multiple of 2, but not of 4
0x10C [12:08] fifo_pretrig_mini = 4  Number of time bins before pre-trigger
```

Once enabled, miniscope data is included in every event readout that contains a full header.

Events the contain miniscope data will have

- 1) header19[14] `mini_read_enable` = 1 to indicate the event includes miniscope data.
- 2) 06B07 begin minscope marker in the data stream, located after GEM and main-scope data
- 3) Typically 22 miniscope time-bin data words
- 4) 06E07 end miniscope marker

The number of minscope time-bin data words depends on the VME register `0x10C[7:3]`.

Because the total number of words in the DMB readout is required to be a multiple of 4, and 2 words are used for 06E07/06E07 markers, the number of miniscope time-bin words must be a multiple of 2, but not a multiple of 4.

The first word after the 06B07 marker contains the number of minscope time-bins, which along with the `mini_read_enable` bit in header19[14] allows event-unpacking software to locate the miniscope data markers and predict the total event word count.

Miniscope data is inserted between GEM and Blocked-bits list

1	6ECB	marker	End of blocked cfeb distrip list	

22 words				

Blocked DiStrips list includes:

- DiStrips turned off via VME Hot Channel Mask
- DiStrips turned off via mask_all applied to the entire CFEB
- DisStrips marked as bad by automatic bad-bits detection

CFEB DiStrip Bit Packing

Each CFEB has 6 layers of 8 DiStrips = 48 bits

```
block_distrip_list[ 7: 0] = Layer0 Ds[7:0]
block_distrip_list[15: 8] = Layer1 Ds[7:0]
block_distrip_list[23:16] = Layer2 Ds[7:0]
block_distrip_list[31:24] = Layer3 Ds[7:0]
block_distrip_list[39:32] = Layer4 Ds[7:0]
block_distrip_list[47:40] = Layer5 Ds[7:0]
```

Which are packed into 4 readout words, 12 bits per word = 48 bits

```
CFEBn word 0 = block_distrip_list[11: 0]
CFEBn word 1 = block_distrip_list[23:12]
CFEBn word 2 = block_distrip_list[35:24]
CFEBn word 3 = block_distrip_list[47:36]
```

Header Word Descriptions

First 4 header words must conform to DDU format specification:

header00_[11:0]	12'hB0C	Beginning of Cathode record marker
header00_[14:12]	3'b101	DDU code for TMB/ALCT
header00_[15]	1	DDU special-word flag

header01_[11:0]	pop_bxn_counter[11:0]	BXN pushed into L1A queue at L1A arrival
header01_[14:12]	3'b101	DDU code for TMB/ALCT
header01_[15]	1	DDU special-word flag

header01 notes:

- bxn_counter contains the value of the 12-bit BXN counter at the time
- L1A arrives, and is typically 128bx later than the pre-trigger BXN (see header08).
- Readouts will always have bxn_counter, but may or may not have pre-trigger data.

header02_[11:0]	pop_l1a_rx_counter[11:0]	L1As received by TMB
header02_[14:12]	3'b101	DDU code for TMB/ALCT
header02_[15]	1	DDU special-word flag

header03_[11:0]	readout_counter[11:0]	Counts L1A readouts
-----------------	-----------------------	---------------------

header03_[14:12]	3'b101	DDU code for TMB/ALCT
header03_[15]	1	DDU special-word flag

Next 4 words for short-header mode or full-header:

header04_[4:0]	board_id[4:0]	TMB module ID number = VME slot number 1-20
header04_[8:5]	csc_id[3:0]	Chamber ID number, set by VME register
header04_[12:9]	run_id[3:0]	Run info, set by VME register
header04_[13]	= buf_q_ovf_err	Tried to push new event when queue full
header04_[14]	= r_sync_err	BXN sync error

header04 notes:

- board_id defaults to the VME crate slot number, unless overridden via VME
- csc_id is a user-set value to identify the CSC connected to this TMB
- run_id is a user-set value to identify the current data run
- buf_q_ovf indicates that more L1As arrived than TMB was able to push into its
- readout processing queue. In this case the average trigger rate is probably higher than the
- readout data path can tolerate
- sync_err indicates that bx0 did not arrive when the BXN counter turned over to the bxn-preset value. Either bx0 is not functioning, or the 40 MHz clock gained or lost counts. A sync_err is latched-on until ttc_resync or ttc_bxreset.

header05_[5:0]	r_nheaders[5:0]	Number of header words
header05_[8:6]	fifo_mode[2:0]	Raw hits fifo readout mode set via VME
header05_[10:9]	r_type[1:0]	Record type: dump, nodump, full header, short header
header05_[12:11]	lla_type[1:0]	L1A Pop type code: buffers, no buffers, clct/alct_only
header05_[13]	r_has_buf	Event has clct and gem buffer data // --EDIT, was RPC
header05_[14]	r_buf_stalled	Buffer write pointer hit a fence and stalled

header05 notes:

- 1) nheaders indicates the length of the current header block, including the BOC marker to 1 frame before the EOB marker. In current firmware it will be 8 for short headers and 42 for full.
- 2) FIFO Modes:

mode	raw hits	header
0	no	full (if buffer was available at pre-trigger)
1	all 5 CFEBs	full (if buffer was available at pre-trigger)
2	local	full (if buffer was available at pre-trigger), local=sparsified cfebs
3	no	short
4	no	no

- 3) Record Type Codes:

r-type	raw hits	header
--------	----------	--------

0	no	full	
1	full	full	
2	local	full	
3	no	short	(no buffer was available at pre-trigger)

4) L1A Type Codes:

l1a-type		
0	Normal CLCT trigger with buffer data and L1A window match	
1	ALCT-only trigger, no data buffers	(not usually read out)
2	L1A-only, no matching TMB trigger, no buffer data	(not usually read out)
3	TMB triggered, no L1A-window match, event has buffer data	(not usually read out)

header06_[14:0]	bd_status[14:0]	Board status summary
-----------------	-----------------	----------------------

header06 notes:

bd_status[0]	bd_status_ok	Board all-OK: voltages OK, temperature OK, prom-load OK
bd_status[1]	vstat_5p0v	Voltage Comparator +5.0V, 1=OK
bd_status[2]	vstat_3p3v	Voltage Comparator +3.3V, 1=OK
bd_status[3]	vstat_1p8v	Voltage Comparator +1.8V, 1=OK
bd_status[4]	vstat_1p5v	Voltage Comparator +1.5V, 1=OK
bd_status[5]	*t_crit	Temperature ADC Tcritical 1=OK
bd_status[6]	vsm_ok	VME Machine ran without errors
bd_status[7]	vsm_aborted	VME State machine aborted reading PROM
bd_status[8]	vsm_cksum_ok	VME Check-sum matches PROM contents
bd_status[9]	vsm_wdcnt_ok	VME Word count matches PROM contents
bd_status[10]	jsm_ok	JTAG state machine completed without errors
bd_status[11]	jsm_aborted	JTAG State machine aborted reading PROM
bd_status[12]	jsm_cksum_ok	JTAG Check-sum matches PROM contents
bd_status[13]	jsm_wdcnt_ok	JTAG Word count matches PROM contents
bd_status[14]	jsm_tck_fpga_ok	FPGA jtag tck detected correctly

header07_[14:0]	revcode[14:0]	Firmware version date code
-----------------	---------------	----------------------------

header07 notes:

revcode[05:00]	Minor version (minor features, internal fixes, bug fixes, etc)
revcode[10:06]	Major Version (major feature changes which break compatibility)
revcode[14:11]	DAQ data format version
-assumption for Data Format Version: 0=TMB standard, 1=OTMB Standard, 2=OTMB+GEM w/ILT MPC Frame format	

Full Header-mode words 8-EOB: Event Counters

header08_[11:0]	r_bxn_counter_ff[11:0]	CLCT Bunch Crossing number at pre-trigger, 0-3563
-----------------	------------------------	---

header08_[12]	r_tmb_clct0_discard;	TMB discarded clct0 from ME1A
header08_[13]	r_tmb_clct1_discard;	TMB discarded clct1 from ME1A
header08_[14]	clock_lock_lost	Main DLL clock lost lock

header09_[14:0]	r_pretrig_counter[14:0]	Counts CLCT pre-triggers [stops on ovf]
header10_[14:0]	r_pretrig_counter[29:15]	
header11_[14:0]	r_clct_counter[14:0]	Counts CLCTs post-drift [stops on ovf]
header12_[14:0]	r_clct_counter[29:15]	
header13_[14:0]	r_trig_counter[14:0]	Counts TMB triggers to MPC, L1A request to CCB,
header14_[14:0]	r_trig_counter[29:15]	[stops on ovf]
header15_[14:0]	r_alct_counter[14:0]	Counts ALCTs received from ALCT board [stops on ovf]
header16_[14:0]	r_alct_counter[29:15]	
header17_[14:0]	r_orbit_counter[14:0]	BX0s since last hard reset [stops on ovf]
header18_[14:0]	r_orbit_counter[29:15]	

CLCT Raw Hits Size:

header19_[2:0]	r_ncfebs[2:0]	Number of CFEBs read out
header19_[7:3]	r_fifo_tbins[4:0]	Number of time bins per CFEB in dump
header19_[12:8]	fifo_pretrig[4:0]	Number of time bins before pre-trigger
header19_[13]	scope_data_exists	Readout includes logic analyzer scope data
header19_[14]	mini_read_enable	Readout includes miniscope data, 22wds+2markers

CLCT Configuration:

header20_[2:0]	hit_thresh_pretrig[2:0]	Hits on pattern template pre-trigger threshold
header20_[6:3]	pid_thresh_pretrig[3:0]	Pattern shape ID pre-trigger threshold
header20_[9:7]	hit_thresh_postdrift[2:0]	Hits on pattern post-drift threshold
header20_[13:10]	pid_thresh_postdrift[3:0]	Pattern shape ID post-drift threshold
header20_[14]	stagger_hs_csc	CSC Staggering ON
header21_[3:0]	triad_persist[3:0]	CLCT Triad persistence
header21_[6:4]	dmb_thresh_pretrig[2:0]	DMB pre-trigger threshold for active-cfeb list
header21_[10:7]	alct_delay[3:0]	Delay ALCT for CLCT match window
header21_[14:11]	clct_window[3:0]	CLCT match window width

CLCT Trigger Status:

header22_[8:0]	r_trig_source_vec[8:0]	Pre-trigger source vector
header22_[14:9]	r_layers_hit_vec[5:0]	CSC layers hit on layer trigger

header22 notes:

trig_source [0]	CLCT pattern triggered sequencer
trig_source [1]	ALCT pattern triggered sequencer
trig_source [2]	ALCT*CLCT pattern triggered sequencer
trig_source [3]	ADB external triggered sequencer
trig_source [4]	DMB external triggered sequencer
trig_source [5]	CLCT (CCB scintillator) external triggered sequencer
trig_source [6]	ALCT (CCB) external triggered sequencer
trig_source [7]	VME triggered sequencer
trig_source [8]	Layer-mode trigger

header23_[4:0]	r_active_feb_mux[4:0]	Active CFEB list sent to DMB
header23_[9:5]	r_cfebs_read[4:0]	CFEBs read out for this event
header23_[13:10]	pop_l1a_match_win[3:0]	Position of l1a in window
header23_[14]	active_feb_src	Active CFEB list source, 0=pretrig, 1=at TMB match

CLCT+ALCT Match Status:

header24_[0]	r_tmb_match	ALCT and CLCT matched in time, pushed into L1A queue
header24_[1]	r_tmb_alct_only	Only ALCT triggered, pushed into L1A queue
header24_[2]	r_tmb_clct_only	Only CLCT triggered, pushed into L1A queue
header24_[6:3]	r_tmb_match_win[3:0]	Location of alct in clct window, pushed into L1A queue
header24_[7]	r_no_alct_tmb;	No ALCT
header24_[8]	r_one_alct_tmb;	One ALCT
header24_[9]	r_one_clct_tmb;	One CLCT
header24_[10]	r_two_alct_tmb;	Two ALCTs
header24_[11]	r_two_clct_tmb;	Two CLCTs
header24_[12]	r_dupe_alct_tmb;	ALCT0 copied into ALCT1 to make 2 nd LCT
header24_[13]	r_dupe_clct_tmb;	CLCT0 copied into CLCT1 to make 2 nd LCT
header24_[14]	r_rank_err_tmb;	LCT1 has higher quality than LCT0, error

CLCT Trigger Data:

header25_[14:0]	r_clct0_tmb[14:0]	CLCT0 after drift lsbs
header26_[14:0]	r_clct1_tmb[14:0]	CLCT1 after drift lsbs
header27_[0]	r_clct0_tmb[15]	CLCT0 after drift msbs
header27_[1]	r_clct1_tmb[15]	CLCT1 after drift msbs
header27_[4:2]	r_clctc_tmb[2:0]	CLCT0/1 common after drift msbs
header27_[5]	r_clct0_invp	CLCT0 had invalid pattern after drift delay
header27_[6]	r_clct1_invp	CLCT1 had invalid pattern after drift delay
header27_[7]	r_clct1_busy	2 nd CLCT busy, logic error indicator

header27_[12:8] detection	perr_cfeb_ff[4:0]	CFEB raw hits RAM parity error, latched, SEU
header27_[13] 0 detection	FREE_perr_ff perr_mini_ff	FREE -was raw hits RAM parity error, latched, SEU
header27_[14] 0	perr_ff	Raw hits RAM parity error summary, latched, SEU

header25-27 notes:

clct0, clct1, clctc packing format:		
clct0[0]	clct_1 st _valid	Valid pattern flag
clct0[3:1] hs_hit_1 st [2:0]		Hits on pattern 0-6
clct0[7:4] hs_pid_1 st [3:0]		Pattern shape 0-A
clct0[15:8] hs_key_1 st [7:0]		½-strip ID number
clct1[0]	clct_2 nd _valid	Valid pattern flag
clct1[3:1] hs_hit_2 nd [2:0]		Hits on pattern 0-6
clct1[7:4] hs_pid_2 nd [3:0]		Pattern shape 0-A
clct1[15:8] hs_key_2 nd [7:0]		½-strip ID number
clctc[1:0] clct0/1	bxn_counter_ff[1:0]	Bunch crossing number at pretrigger, common to clct0/1
clctc[2] clct0/1	sync_err	BX0 disagrees with BXN count, common to clct0/1

ALCT Trigger Data:

header28_[0]	alct_1 st _valid	ALCT0 valid pattern flag
header28_[2:1] alct_1 st _quality[1:0]		ALCT0 quality
header28_[3]	alct_1 st _amu	ALCT0 accelerator muon flag
header28_[10:4]	alct_1 st _key[6:0]	ALCT0 key wire group
header28_[14:11]	alct_pretrig_win[3:0]	ALCT active_feb_flag position in pretrig window
header29_[0]	alct_2 nd _valid	ALCT1 valid pattern flag
header29_[2:1] alct_2 nd _quality[1:0]		ALCT1 quality
header29_[3]	alct_2 nd _amu	ALCT1 accelerator muon flag
header29_[10:4]	alct_2 nd _key[6:0]	ALCT1 key wire group
header29_[12:11]	drift_delay[1:0]	CLCT drift delay
header29_[13]	bcb_read_enable	CFEB blocked DiStrip bits list included in readout
header29_[14]	hs_layer_trig	Layer-mode trigger
header30_[4:0] alct_bxn[4:0]		ALCT0/1 bxn
header30_[6:5] alct_ecc_err[1:0]		ALCT trigger path ECC error code
header30_[11:7]	cfeb_badbits_found[4:0]	Bad distrip bits detected in cfeb[n]
header30_[12]	cfeb_badbits_blocked	At least one CFEB has a bad bit that was blocked
header30_[13]	alct_cfg_done	ALCT FPGA configuration done

header30_[14]	bx0_match	alct_bx0==clct_bx0, latched at clct_bx0 time
---------------	-----------	--

MPC Frames: For 2019: Edit GEM block!

header31_[14:0]	r_mpc0_frame0_ff[14:0]	MPC muon 0 frame 0 LSBs
header32_[14:0]	r_mpc0_frame1_ff[14:0]	MPC muon 0 frame 1 LSBs
header33_[14:0]	r_mpc1_frame0_ff[14:0]	MPC muon 1 frame 0 LSBs
header34_[14:0]	r_mpc1_frame1_ff[14:0]	MPC muon 1 frame 1 LSBs
header35_[0]	= r_mpc0_frame0_ff[15]	MPC muon 0 frame 0 MSB
header35_[1]	= r_mpc0_frame1_ff[15]	MPC muon 0 frame 1 MSB
header35_[2]	= r_mpc1_frame0_ff[15]	MPC muon 1 frame 0 MSB
header35_[3]	= r_mpc1_frame1_ff[15]	MPC muon 1 frame 1 MSB
header35_[7:4]	mpc_tx_delay[3:0]	MPC transmit delay
header35_[9:8]	r_mpc_accept[1:0]	MPC muon accept response
header35_[14:10]	cfeb_en[4:0]	CFEBs enabled for triggering (didn't fit elsewhere)

header31-35 notes:

MPCframe packing format:

```

mpc0_frame0[6:0]      =      alct0_key[6:0];
mpc0_frame0[10:7]     =      clct0_pattern[3:0]; //was clct0_bend[3:0]
mpc0_frame0[13:11]    =      lct0_quality[2:0] * lct0_vpf; //Check VPF requirement!!
mpc0_frame0[14]       =      clct0_QuarterStrip;
mpc0_frame0[15]       =      lct0_vpf; // EighthStrip was proposed

header39_[13]        reverse_hs_mela            1=ME1A hstrip order reversed

header39_[14]        reverse_hs_melb            1=ME1B hstrip order reversed

header40_[1:0] active_feb_mux[6:5];             Extend Hdr23[4:0]    Active CFEB list sent to DMB

header40_[3:2] r_cfefs_read[6:5];               Extend Hdr23[9:5]    CFEBs read out for this event

header40_[5:4]      perr_cfef_ff[6:5];          Extend Hdr27[12:8]   CFEB RAM parity error, latched

header40_[7:6]      cfef_badbits_found[6:5];    Extend Hdr30[11:7]   CFEB[n] has at least 1 bad bit

header40_[9:8]      cfef_en[6:5];               Extend Hdr35[14:10] CFEBs enabled for triggering

header40_[10]       buf_fence_cnt_is_peak; Current fence is peak number of fences in RAM

header40_[11]       (MXCFEB==7);               TMB has 7 DCFEBs so hdr40_[10:0] are active

header40_[13:12]    r_trig_source_vec[10:9]     Pre-trigger source vector for ME1A/B

```

header40_[14]	r_tmb_trig_pulse	TMB trig_pulse signal matched rtmb_push
---------------	------------------	---

Spare Frame:

header41_[0]	tmb_allow_alct	Allow ALCT-only tmb-matching

CONFIGURATION FOR 2019,2013,2005: STILL ACCURATE?

Shunt Settings

Table 3: Shunts

#	Shunt	Default	Function	
1	SH501 [CLK SRC]	1-2 [CCB]	1-2 [CCB] 2-3 [XTAL]	CCB sources TMB s 40MHz Main clock Onboard crystal sources TMBs 40MHz Main clock
2	SH502 [CFEB CLK]	2-3 [DCC]	1-2 [NRM] 2-3 [DCC]	CFEB clocks sourced by 3D3444 64/36 duty-cycle CFEB clocks duty-cycle corrected
3	SH55 [GBL]	1-2 [ENA]	1-2 [ENA] 2-3 [DIS]	Boot Register responds to TMB VME Global Address Boot Register ignores TMB VME Global Address
4	SH56 [GEO]	1-2 [ENA]	1-2 [ENA] 2-3 [DIS]	Boot Register responds to VME Geographic Address Boot Register ignores VME Geographic Address
5	SH57 [ADM]	1-2 [REQ]	1-2 [REQ] 2-3 [PAS]	Boot Register requires VME Address Mode 39h or 3Dh Boot Register accepts any VME Address Mode
6	SH97 [FPGA]	1-2 [ENA]	1-2 [ENA] 2-3 [DIS]	Cleared Boot Register enables FPGA VME access Cleared Boot Register disables FPGA VME access
7	SH69-1 [REG IN]	2-3 [REG]	1-2 [BPL] 2-3 [REG]	Disconnect +3.3V from U69 1.5V regulator input Connect +3.3V to U69 1.5V regulator input
8	SH69-2 [REG OUT]	2-3 [REG]	1-2 [BPL] 2-3 [REG]	Backplane sources +1.5Vtt Onboard regulator U69 sources +1.5Vtt
9	SH95 [BOOT]	1-2 [EN]	1-2 [EN] 2-3 [DIS]	CCB hard-reset clears Boot Register CCB hard-reset does not clear Boot Register
10	SH104 [VME]	1-2 [EN]	1-2 [EN] ALCT 2-3 [DIS]	VME write to Boot Register can hard-reset TMB or Boot Register can not hard-reset TMB or ALCT
11	SH105 [CCB]	1-2 [EN]	1-2 [EN] 2-3 [DIS]	CCB can hard-reset TMB or ALCT CCB can not hard-reset TMB or ALCT
12	SH106 [ALCT]	1-2 [EN]	1-2 [EN] Boot 2-3 [DIS]	TMB FPGA can hard-reset ALCT board if enabled by Boot TMB FPGA firmware can not hard-reset ALCT board
13	SH107 [SELF]	2-3 [DIS]	1-2 [EN] 2-3 [DIS]	TMB FPGA firmware can hard-reset TMB TMB FPGA firmware can not hard-reset TMB
14	SH1081 [ALCT]	1-2 [EN]	1-2 [EN] 2-3 [DIS]	TMB can send hard-reset to ALCT board TMB can not send hard-reset to ALCT board
15	SH1082 [TMB]	1-2 [EN]	1-2 [EN] 2-3 [DIS]	TMB can send hard-reset to TMB TMB can not send hard-reset to TMB
16	SH1083 [RPC]	1-2 [EN]	1-2 [EN] 2-3 [DIS]	TMB can send hard-reset to RAT/RPC board TMB can not send hard-reset to RAT/RPC board

17	SH1084 [PUP]	1-2 [EN]	1-2 [EN] 2-3 [DIS]	Issue hard-reset to TMB on power-up Do not issue hard-reset to TMB on power-up
18	SH62 [VMEADR]	1-2 [GEO]	1-2 [GEO] 2-3 [LCL]	Slot Address derived from VME backplane GEO pins Slot Address derived from SW2/SW1 hex switches
19	SH74 [JTAG SRC]	2-3 [SW3]	1-2 [XBL] 2-3 [SW3]	X-blaster board sources JTAG chain address Onboard SW3 hex switch sources JTAG chain address
20	SH921 [RAT ADC]	1-2 [ACORE]	1-2 [ACORE] 2-3 [+3.3VR]	ADC Ch9 measures RAT core current ADC Ch9 measures RAT main +3.3V supply

Switch Settings For 2019,2013,2005: Still accurate?

Table 4: Switch Settings

Switch	Module	Default	Function
SW1	VME	A	<p>SW2/SW1 Form the VME slot address for Local Mode addressing and for the Boot Register Global Address.</p> <p>Normally, SH62 [VMEADR] will be set to 1-2 [GEO] and the VME Slot-Address is determined by the Slot-ID signals from the VME P1 backplane connector.</p> <p>SW2/SW1 should be set to 1A [26 decimal] to specify the Boot Register Global Address. SW2 is the most-significant hex digit.</p> <p>If SH62 [VMEADR] is set 2-3 [LCL], hex rotary switches SW2/SW1 determine the VME slot address for the module, and the P1 Geographic Address signals are ignored.</p>
SW2	VME	1	
SW3	JTAG	4	<p>Selects the JTAG Chain Address for the Xblaster when SH74 [JTAG ADR SRC] is set to 2-3 [SW3]. If SH74 is set 1-2 [XBL], the JTAG Chain Address is determined by the Xblaster.</p> <pre> 0000 0 ALCT SLOW USER 0001 1 ALCT SLOW PROM 0010 2 ALCT FPGA USER 0011 3 ALCT FPGA PROMs 01XX 4 TMB FPGA PROMs 10XX 8 TMB User PROMs 1100 C TMB FPGA Loop (for TMB self-test) 1101 D RAT FPGA PROM </pre>

Fuses

Table 5: Fuses for TMB2005

Fuse	Circuit	Amps	LED	Function	Littelfuse Part #
F1	+5.0V	5A	D_F1 Red	VME-bus I/O	154005.DR
F2	+3.3V	10A	D_F2 Red	Main board logic, FPGA IOBs	154010.DR
F3	+1.5V	5A	None	GTLP termination	154005.DR
F4	+3.3VXB	1A	D_F4 Grn	Xblaster power	154001.DR

Table 6A: Fuses for TMB2013

Fuse	Circuit	Amps	LED	Function	Littelfuse Part #
F1	+5.0V	10A	D_F1 Red	VME-bus I/O	0451010.MRL
F2	+3.3V	15A	D_F2 Red	Main board logic, FPGA IOBs	0451015.MRL

RPC For 2019,2013: Delete or deprecate! Replace with RAT??

80 Inputs 40MHz LVTTTL [from receivers on transition module]

0 Outputs

Table 13: RPC Signal Summary

Signal	Bits	Dir	Logic	Function
rpc0_seg[15..0]	16	In	LVTTTL	RPC Segment[15..0]
rpc0_bxn[2..0]	3	In	LVTTTL	Bunch Crossing Number [2..0]
rpc0_clock	1	In	LVTTTL	Clock from RPC Link Board
rpc1_seg[15..0]	16	In	LVTTTL	RPC Segment[15..0]
rpc1_bxn[2..0]	3	In	LVTTTL	Bunch Crossing Number [2..0]
rpc1_clock	1	In	LVTTTL	Clock from RPC Link Board
Total data bits	40			

VME

24 Inputs TTL Address

16 BiDir TTL Data

Table 14: VME Signal Summary

Signal	Bits	Dir	Logic	Function
address	24	In	TTL	VME Address[23..0]
data	16	BiDir	TTL	VME Data[15..0]
control in		In	TTL	VME Control Inputs
control out		Out	TTL	VME Control Outputs

JTAG

5 InputsLVDS

1 Outputs LVDS

Table 15: JTAG Signal Summary

Signal	Bits	Dir	Logic	Function
tck	1	In	LVDS	JTAG TCK
tms	1	In	LVDS	JTAG TMS
tdi	1	In	LVDS	JTAG TDI
chain_select	2	In	LVDS	Chain Select Address
tdo	1	Out	LVDS	JTAG TDO

LEDs & Testpoints

Table 16: TMB Front Panel LEDs

LED Label	Color	Function
LCT	Blue	ALCT vpf and CLCT vpf match within the 75ns ALCT window (see note below)
ALCT	Green	ALCT active FEB flag (may not always be the same as ALCT valid pattern flag)
CLCT	Green	CLCT active FEB flag Or any external trigger except ALCT
L1A	Green	Level 1 Accept arrived in L1A window
INVP	Yellow	Invalid CLCT pattern after drift delay Pattern dropped below threshold, probably triggered on noise
NMAT	Yellow	ALCT vpf or CLCT vpf arrived but did not match in ALCT window
NL1A	Red	No Level 1 Accept arrived in L1A window after TMB triggered Constant flash rate = buffers full
VME	Green	ON = TMB FPGA loaded successfully from PROM Flashes OFF when module addressed by VME

Table 12A: Mez-2013 SMT LEDs

LED Label	Color	Function
D1	Blue	When lit, indicates at least one fiber link had an error since last reset
D2	Green	When lit, indicates TMB clock0 MMCM has locked since the last reset
D3	Yellow	When lit, indicates TMB clock0 MMCM is not currently locked
D4	Red	When lit, indicates TMB clock0 MMCM lost lock at least once since the last reset
D5	Green	When lit, indicates the QPLL has locked since the last reset
D6	Yellow	When lit, indicates the QPLL is not currently locked
D7	Red	When lit, indicates the QPLL lost lock at least once since the last reset
D8	Green	When lit, indicates at least one fiber link has a stable input
D0	Yellow	When lit, indicated the FPGA is Not Programmed (i.e. DONE is False)

Table 12B: Mez-2013 Testpoints

Testpoint Label	Function
9	TRUE indicates at least one fiber link had over 100 errors since the last reset
8	TRUE indicates all fiber links have a stable input
7:1	TRUE signals indicate that links 7:1 have a stable input, respectively

TMB Total I/O Count For 2019, etc: Fix connectors, MTPs, and RPC -> RAT

Table 17: TMB Total I/O Count

Bits	Pins	Dir	Logic	Connect To	Function
1	2	In	LVDS	CCB	Clock Bus
26	26	In	GTLP	CCB	Fast Control Bus
4	4	In	GTLP	CCB	TMB Reload Bus
12	12	In	GTLP	CCB + 9 DMB + 9 TMB	DAQ Special Purpose Bus
7	7	In	GTLP	CCB + 9 TMB	Trigger Special Purpose Bus
240	120	In	LVDS	5 CFEBs	CFEB Comparators
57	29	In	LVDS	ALCT	ALCT Module
6	6	In	LVTTL	1 DMB	DMB commands
2	1	In	GTLP	MPC	MPC winner
80	40	In	LVTTL	RPC	RPC Inputs
24	24	In	TTL	VME	VME Address

J7 Xilinx LVDS Xilinx X-Blaster Connector

Function: Connects TMB2005 to LVDS x-Blaster for programming FPGAs and PROMs.

The LVDS signals and voltage sources on this connector are not directly compatible with the standard Xilinx programming cable.

JTAG chain select signals SEL[3:0] are TTL ⊕.

Connector Type: PCB: 3M 3316-5002 16-pin right angle center key
Cable: 3M 3452-6600 16-pin center bump

P2A Backplane CCB+DMB Connector

Function: Sends and receives data to/from CCB, and carries some DMB signals.

Connector Type: PCB: AMP Z-Pack 125 (25 rows of 5 pins) female AMP 100145-1
Backplane: AMP Z-Pack 125 (25 rows of 5 pins) male AMP ?

DOCUMENTATION REVISION HISTORY

Version	Date	Action
1.00	07/12/2003	Initial, copied from TMB2001
1.01	10/29/2003	Replaced PHOS4 registers with DDD, update shunts table, rat signals updated
1.02	03/15/2004	Update 3D3444 registers, add RAT/RPC registers
1.03	03/16/2004	Move RAT register addy to match bdtest.v
1.04	04/15/2004	Copy from TMB2003
2.01	05/19/2004	Add RPC Readout
2.01	06/09/2004	New registers B6-CC, 4 new header words, new raw hits format, started logic docs
2.02	06/10/2004	Add mpc_tx_delay, modify header 21,22
2.03	06/18/2004	Add register CE for new scope trigger source, add mpc data format
2.04	07/23/2004	Add nph_pattern to header word 21
2.05	08/03/2004	Add counter registers
2.06	10/01/2004	Add scp bit to header
2.07	10/04/2004	Add mpc_bx0 to reg ADR_TMB_TRIG
2.08	10/07/2004	Typos fixed
2.09	12/15/2004	Typos fixed
3.00	06/02/2005	Ported from TMB2004 v2.09 dated 12/15/04
3.00	06/09/2005	Add rpc_hard_reset to boot reg, update ADR_LOOPBK for RAT signals
3.01	06/28/2005	alct_rxoe, alct_txoe in 0E are now readonly to foil errant software
3.02	08/01/2005	Change default alct_status_en, tmb_status_en=0 for multi-crate use
3.03	08/08/2005	Change c_status_oe to ccb_status_oe
3.04	02/27/2006	Add configuration section
3.05	05/24/2006	Add jtag state machine registers, add alct scope channels
3.06	07/28/2006	Add vme state machine registers, update raw hits header, add prom info
3.07	08/08/2006	Add layer-or trigger mode
3.08	09/05/2006	Add rat delay registers
3.09	09/15/2006	Add CLCT processing steps
3.10	10/16/2006	Add ISE Version register, triad persistence default now 6 for 6 clocks
3.11	04/09/2007	Reduce RPCs from 4 to 2, add mpc_oe, affects 86,B6,BA,BE,C4,CA,CC,header22
3.12	04/11/2007	Remove duplicate header22 description, update header tables
3.13	04/27/2007	Add ignore ttc_start/stop to ADR 2C, expand fmm_state in ADR 9C
3.14	05/16/2007	New pattern finder registers
4.01	05/24/2007	New clct pattern finder algorithm

Version	Date	Action
4.02	06/21/2007	New pattern ID numbers, new layer triggermods to Adrs 10,D4, and A0,A6,A8,AA,CA,CC,header16
4.03	07/05/2007	Key layer shifted from ly3 to ly2, adjcfeb_dist expanded to 6 bits, activefeb bugfix
4.04	07/10/2007	Firmware update, no change to doc
4.05	07/24/2007	Update Adr 78,88,8C descriptions to match current CLCT0/1 4-bit pattern IDs
4.06	07/26/2007	Fix text for adr 68, 6C, A6
4.07	08/06/2007	Increase injector read-write adr to 10 bins in Adr 44, Adr BE
4.08	08/30/2007	New header/trailer format
4.09	09/04/2007	Mods to header format, expand VME counters to 30 bits
4.10	09/10/2007	New fields in header 24, new VME counters
4.11	09/14/2007	Header bug fixes, new no-alct counter
4.12	09//21/2007	Push hsds bit into pat[3] in documentation
4.13	12/17/2007	Switch to big-buffer logic
4.14	01/28/2008	Replace entire L1A logic, replace lct_quality
4.15	02/05/2008	Add raw hits RAM parity errors to header27
4.16	04/29/2008	Major update for new flow-through triggering
4.17	05/01/2008	All scope channels reassigned, header frame bug fixes
4.18	05/12/2008	Add clct + alct bx0 heartbeat to mpc_tx[11], mpc_tx[27]
4.19	05/23/2008	Adr B0[15:14] Add clock_lock_lost and sync_er
4.20	06/03/2008	Add counter clears on ttc_resync, add alct debug to scope, new active_feb_flag
4.21	07/09/2008	Replace jtag state machine, rename thresh signals, add pid_thresh_postdrift
4.22	07/15/2008	non-trigger readout mods
4.23	08/12/2008	Add bx0_match, add mela/b separation ram mux, add alct data tx delay
4.24	08/28/2008	Programmable stagger removed, csc firmware types created, new counters
4.25	09/12/2008	Add tmb logic signals to header40,41
4.26	09/16/2008	Update tables for header words 36(rpc),40,41. Updated sample raw hits dump
4.27	10/01/2008	Mod header08,36,40,41, replaced scope module and vme register, jtag sel
4.28	11/18/2008	Add reg FE, L1A and parity logic mods, add sync err and parity err counters
4.29	11/19/2008	Remove stagger_csc from Adr F4[1], staggering info is in Adr CC
4.30	12/10/2008	Add l1a_lookback mode, l1a_lookback reg + sequencer debug reg; add parity ram
4.31	02/05/2009	Add alct-loopback logic in alct.v module
4.32	03/16/2009	Add ecc to alct data, add ecc counters, add cfeb counters
4.33	04/15/2009	Updates for alct 80MHz output stages
4.34	05/15/2009	Miniscope added, RPC readout mods, bx0 test mode

Version	Date	Action
4.35	05/29/2009	Add alct muonic timing
4.36	06/22/2009	More alct muonic mods
4.37	06/29/2009	Replace alct_txd, alct_rxd DDD delays with digital phase shifters
4.38	07/13/2009	Add cfeb muonic timing, 5 digital phase shifters, 2 vme delay registers
4.39	08/14/2009	CFEB muonic version, removed cfeb and alct_rx posnegs, still has alct_tx posneg
4.40	08/25/2009	ALCT+CFEB muonic with posneg sync stages, ISE 8.2sp3
4.41	09/02/2009	Correct adr 16
4.42	09/08/2009	Add digital phase shifter autostart
4.43	09/21/2009	Add sync register 0x120, limit bxn offsets to be < lhc_cycle
4.44	10/15/2009	Add alct0==alct1 error counter, change D0[5] default to 1, enables alct err counter
4.45	11/23/2009	Text corrections
4.46	12/09/2009	Add alct and cfeb muonic figures
4.47	12/16/2009	Add cfeb bad bit detection and registers
4.48	01/14/2010	Add cfeb bad bit list to header30, mod bad bit ctrl reg
4.49	02/10/2010	Add event clear for aff, clct, mpc VME diagnostic registers
4.50	03/12/2010	Add blocked bits readout, clct-only mode bug fix
4.51	04/09/2010	Fix header30 typo, add firmware log for 3/19/2010 version
4.52	05/14/2010	Mod Adr 0x2A and Adr 0x120, add firmware log for 5/14/10 version
4.53	07/02/2010	Mod Adr 0x32, 0x42, 0x9E, 0x100, and hdr38[14]
4.54	07/08/2010	Move injector ram msbs to lookback reg, revert injector wen,ren
4.55	07/15/2010	Add miniscope section to header chapter
4.56	09/03/2010	Convert to MS Word 2010
4.57	08/17/2012	Add startup delay for ALCT Spartan-6 mezzanine
4.58	09/16/2012	Add Virtex-6 GTX optical receivers
4.59	09/23/2012	Add Virtex-6 Sysmon
4.60	10/15/2012	Change pid_thresh descriptions in adr 0xF4
4.61	03/07/2013	Convert doc to docx, mod header + add registers for 7 DCFEB Virtex-6
4.62	2013/10/24	Change order of keys in LCT quality module, documentation updated accordingly
5.01	2013/12/19	Created assignments for Mez-2013 TPs & SMT LEDs: qpll & mmcm lock monitoring. Also minor corrections for VME GTX register table (Adr 14C-158)
5.02	2014/01/06	Changes to Reset for CFEB badbits, fiber link monitor logic & GTX VME registers 14A-158
5.03	2014/01/08	Add optical links to Fig. 1 and made some minor format changes for some tables

Version	Date	Action
5.04	2014/04/24	Format cleaning. The following styles applied consistently throughout the text: section title – “My Heading 1” subsection title – “My Heading 2” normal text – “Normal” code excerpt – “Code in fixed font” paragraph title – “Paragraph heading” tables – “No spacing” text on figures – “Text box in plot” The styles are stored within document and accessible in Home -> Styles tab in Word
5.05	2014/04/28	Andrew Peck updated tables with the correct TMB2005 backplane pin assignments and connector (now 24,25). Some other minor formatting changes in that general section
5.06	2014/05/15	Add description of 5 new VME registers 17C – 188 to access data sent to MPC stored in FIFO (up to 512 last trigger events)
5.07	2014/06/26	Edited signal synchronization section. Start to edit list of VME addresses
5.08	2014/07/31 2014/08/04	Fix table with bits for Adr 15A ADR_V6_SYSMON Virtex-6 Sysmon ADC Fix table for Adr 16A and 16C changing cfeb0 to cfeb5 and cfeb6
5.09	2015/02/12	Edit VME register details for Adr 146 - 158, also 16A, 16C and 11E Added startup timers in VME Adr 186 - 192
5.10	2015/09/28	Edit counters 81 and 82 controlled by register D0 and read from register D2. GTX errors in these counters are obsolete. Counters of CLCT pre-triggers and L1A (counter 81) and ALCT (counter 82) are added.
5.11	2016/02/04 2016/02/26	Edit names of variables and description in VME register 6A for ALCT window width and delay to overlap with CLCT pre-trigger. Add counters 83-92 controlled by register D0 and read from register D2. These counters are for CFEBs active flags sent to DMB.
5.12	2016/04/14	Edit Figure 1 Edit names of counters 83-92, they are synchronized for OTMB2013 and TMB2005

FIRMWARE CHANGE LOG

Version 1/20/2015

Has redefined **enable** and **reset** control for Virtex-6 SNAP12 GTX fiber optic receivers (Adr 14A-158), and these now control GTX reset and GTX resync respectively

Added registers to monitor startup timing for several modules after a Hard Reset, with 100 ns units (Adr 186-192)

No longer uses the GTX internal RX Delay Align module for DCFEB fibers (which never worked well), but now uses just 2 phasers with one to control A-side DCFEB links (Adr 16A, used to be cfeb5_rxd) and the other for B-side links (Adr 16C, used to be cfeb6_rxd), and Adr 11E is also changed (rxd_int_delay control)

Version 12/26/2014

Improved enable and reset control for Virtex-6 SNAP12 GTX fiber optic receivers (Adr 14A-158)

Added registers to count “lock lost” conditions for MMCM and QPLL (Adr 146 and 148)

Now using the GTX internal RX Delay Align module for DCFEB fibers instead of the phaser clocks

Version 01/06/2014

Improved control & monitoring for Virtex-6 SNAP12 GTX fiber optic receivers

First applied in firmware version 12302013

TTC_Resync now included in reset logic for CFEB badbits

```
cfeb_badbits_reset[4:0] = (cfeb_badbits_ctrl_wr[4:0] | {5{ttc_resync}});
```

```
cfeb_badbits_reset[6:5] = (cfeb_v6_badbits_ctrl_wr[1:0] | {2{ttc_resync}});
```

GTX VME registers 14A-158 changed significantly to reflect improved fiber link monitor & control logic

Removed functions that were not useful (previously accessed in bits 10, 7:4, 2)

Reassigned some other functions to different bits (previous bit 9 → bit 7, bit 3 → bit 2)

Added new functions to bits 6:3 (gtx_link_bad, gtx_link_had_err, gtx_link_good, gtx_rx_sync_done)

Changed the readout response for bits 2:0 in registers 14C – 158 when master GTX control is asserted

When the master GTX control bits are set in register 14A (bits 2:0) they are now accurately reflected in the respective readout bits for the individual GTX links (bitwise OR in each GTX)

The error count now counts link sync failures when the PRBS function is not enabled

An occasional loss of sync for a link is expected due to SEUs, but large numbers of them or repeated occurrences may indicate a problem in the system

Increased the error count size to 8 bits and assigned this to bits 15:8

For registers 14C – 158 the maximum error count is hex E0 (n.b. a count larger than 1 is severe)

Register 14A is the sum of the other 7 counters, with maximum allowed value of hex FE

Version 12/19/2013

Adds diagnostic features for Mez-2013

Applied in firmware versions 12162013 – 12172013

Assign Mez-2013 SMT LEDs to indicate qpll & mmcm lock conditions and status changes

See Table 12A

Assign additional diagnostic signals to the Mez-2013 test points and SMT LEDs

See Tables 12A and 12B

Minor corrections to the table for VME GTX registers (Adr 14C-158)

Removed references to “all”

Version 03/08/2013

Adds support for 7 DCFEBs with Virtex-6

1) Modified ADR_SEQCLCTM=0xB0 Sequencer CLCT msbs Register, Readonly

Added seq_clctmsb_rd[9:8] = clctf_vme[6:5], bits were formerly unused

Now seq_clctmsb_rd[9:3] = clctf_vme[6:0] Active cfeb list at TMB match

2) ADR_PARITY=0xFA Parity errors

Changed sub-address assignments to accommodate DCFEB[6:5]

3) Modified ADR_CNT_CTRL=0xD0 Status Counter Control

Inserted 2 new counters after cnt[18], shifts subsequent counter addresses by 2

cnt_en[19] <= cfeb_hit_at_pretrig[5] CLCT pretrigger is on CFEB5

cnt_en[20] <= cfeb_hit_at_pretrig[6] CLCT pretrigger is on CFEB6

4) Modified ADR_DELAY1_INT=0x11E DDR Interstage delays for DCFEB[6:5]

Added:

cfeb5_rxd_int_delay[3:0] = delay1_int_wr[7:4];

cfeb6_rxd_int_delay[3:0] = delay1_int_wr[11:8];

5) Added ADR_V6_CFEB_BADBITS_CTRL=0x15C CFEB Bad Bits Control/Status

For DCFEB[6:5] badbits, extends 5 bit fields from ADR_CFEB_BADBITS_CTRL

6) Added 6 new bad bit VME registers

ADR_V6_CFEB5_BADBITS_LY01 = 0x15E CFEB5 Bad Bit Array

ADR_V6_CFEB5_BADBITS_LY23 = 0x160 CFEB5 Bad Bit Array

ADR_V6_CFEB5_BADBITS_LY45 = 0x162 CFEB5 Bad Bit Array

ADR_V6_CFEB6_BADBITS_LY01 = 0x164 CFEB6 Bad Bit Array

ADR_V6_CFEB6_BADBITS_LY23 = 0x166 CFEB6 Bad Bit Array

ADR_V6_CFEB6_BADBITS_LY45 = 0x168 CFEB6 Bad Bit Array

7) Added 2 new Digital Phase Shifter VME registers

ADR_V6_PHASER7=0x16A DCM Phase Shifter Register: CFEB5 rxd

ADR_V6_PHASER8=0x16C DCM Phase Shifter Register: CFEB6 rxd

8) Added 6 New hot channel mask registers

ADR_V6_HCM501 = 0x16E CFEB5 Ly0,Ly1 Hot Channel Mask

ADR_V6_HCM523 = 0x170 CFEB5 Ly2,Ly3 Hot Channel Mask

ADR_V6_HCM545 = 0x172 CFEB5 Ly4,Ly5 Hot Channel Mask

ADR_V6_HCM601 = 0x174 CFEB6 Ly0,Ly1 Hot Channel Mask

ADR_V6_HCM623 = 0x176 CFEB6 Ly2,Ly3 Hot Channel Mask

ADR_V6_HCM645 = 0x178 CFEB6 Ly4,Ly5 Hot Channel Mask

9) Modified ADR_MOD_CFG 0x28 TMB Module Configuration Register

Replaced led_flash_rate from mod_cfg_wr[11:10] with cfeb_exists[6:5]

Now: mod_cfg_rd[11:5] = cfeb_exists[6:0] = CFEBs instantiated in this firmware

10) Added new VME register ADR_V6_EXTEND = 0x17A: DCFEB 7-bit extensions

Extends 5-bit cfeb fields in ADR 0x42 and 0x68 to 7 bits

mask_all[6:5] = [1:0] Extend 0x42[4:0] = mask_all[4:0] 1=Enable, 0=Turn off all CFEB inputs

inj_febssel[6:5] = [3:2] Extend 0x42[9:5] = inj_febssel[4:0] 1=Select CFEBn for RAM read/write

injector_mask_cfeb[6:5]=[5:4] Extend 0x42[14:10] = injector_mask_cfeb[4:0] 1=Enable CFEB(n) for injector

cfeb_en_vme[6:5] = [7:6] Extend 0x68[14:10] = cfeb_en_vme[4:0] 1=Enable CFEBs for triggering

11) Modified ADR_LOOPBK 0x0E Loop-Back Control Register 2 remove 2 spare DMB signals

Reassigned dmb_tx_reserved to remove the 2 new active feb bits from the unused list

Updated bits [10:5] to match current firmware

12) TMB-to-DMB Active CFEB List backplane signals extended 5 bits to 7

Assigned 2 new bits to the next available spare DMB signals.

dmb_tx[45:44] <= active_feb_list[6:5]

TMB schematic signals:

Signal res_to_dmb1 is now active_feb_list[5] on backplane pin E10

Signal res_to_dmb2 is now active_feb_list[6] on backplane pin A11

13) Modified header40_[11:0] for 7-bit extensions to various 5-bit header fields

Header40_[11:0] used to contain the peak RAM fence counter for raw hits storage debugging.

The peak count has been removed, but can still be read out with VME, and its dynamic status is indicated by header40_[10].

The flag bit in header40_[11] indicates when bits [10:0] are valid for 7-dcfef firmware versions.

header40_[1:0] = active_feb_mux[6:5]; Extend Hdr23[4:0] Active CFEB list sent to DMB

header40_[3:2] = r_cfebs_read[6:5]; Extend Hdr23[9:5] CFEBs read out for this event

header40_[5:4] = perr_cfeb_ff[6:5]; Extend Hdr27[12:8] CFEB RAM parity error, latched

header40_[7:6] = cfeb_badbits_found[6:5]; Extend Hdr30[11:7] CFEB[n] has at least 1 bad bit

header40_[9:8] = cfeb_en[6:5]; Extend Hdr35[14:10] CFEBs enabled for triggering

header40_[10] = buf_fence_cnt_is_peak; Current fence is peak number of fences in RAM

header40_[11] = (MXCFEB==7); TMB has 7 DCFEBs so hdr40_[10:0] are active

14) Modified raw hits readout

Readout can now include raw hits from 0 to 7 CFEBs, as

indicated by cfebs_read[6:0]. The 7-bit CFFEB list cfebs_read[6:0] is constructed from cfebs_read[4:0] in header23_[9:5] and cfebs_read[6:5] in header40_[3:2].

In 5-CFEB firmware versions, header40[11] is zero (unless there is a fault in the readout logic).

A zero in header40_[11] indicates a 5-CFEB TMB, and the bits in header40_[10:0] should not be used to extend 5-bit fields (cfebs_read for instance).

15) Blocked bits readout

Readout can now include blocked hits from 0 to 7 CFEBs, as indicated by cfebs_read[6:0].

Version 09/23/2012

Add VME register 0x15A: ADR_VIRTEX6_SYSMON

Version 09/16/2012

Adds support for Virtex-6 SNAP12 GTX fiber optic receivers

Add VME register 0x148: ADR_VIRTEX6_SNAP12_QPLL

Virtex-6 mezzanine QPLL reset and status

Virtex-6 mezzanine SNAP12 receiver serial interface

Add VME register 0x14A: ADR_VIRTEX6_GTX_RX_ALL

GTX control and status common to all 7 receivers

3) Add 7 VME registers 0x14C-0x158: ADR_VIRTEX6_GTX_RX0 - ADR_VIRTEX6_GTX_RX6

GTX control and status for individual receivers

4) Add event counters 79-85:

GTX receiver counters for fibers 0-6

Clears on gtx_rx_reset_err_cnt

5) Add mezzanine test points for GTX receiver [0]

```
`ifndef VIRTEX6
    assign meztp20 = gtx_rx_start[0];
    assign meztp21 = gtx_rx_valid[0];
```

```

    assign meztp22 = gtx_rx_match[0];
    assign meztp23 = gtx_rx_fc[0];
    assign meztp24 = alct_wait_cfg;
    assign meztp25 = lock_tmb_clock0;
    assign meztp26 = 0;
    assign meztp27 = sump;
`else
    assign meztp20 = alct_startup_msec;
    assign meztp21 = alct_wait_dll;
    assign meztp22 = alct_startup_done;
    assign meztp23 = alct_wait_vme;
    assign meztp24 = alct_wait_cfg;
    assign meztp25 = lock_tmb_clock0;
    assign meztp26 = 0;
    assign meztp27 = sump;
`endif

```

Version 08/17/2012

Delay JTAG PROM data stream to ALCT by 116msec to allow Spartan-6 mezzanine to finish configuration.

Spartan-6 takes 212msec to configure and TMB takes 100msec.

TMB sends JTAG data to ALCT $100+116=216$ msec, after a simultaneous hard reset.

The 4msec pad allows ALCTs DLL/PLL time to lock.

2) Add VME register Adr 0x144 ALCT Spartan-6 startup delay

3) Add VME register Adr 0x146 ALCT Spartan-6 startup state machine status

4) Change Adr 0xD4[2]=jsm_sel, was Write-only, is now Read/Write

Version 07/07/2010

1) Injector RAM mods:

Move injector RAM data msbs [17:16] from 0x44 to 0x100

Revert 0x44 wen and ren to independent RAM enables

Version 07/04/2010

- 1) Changed default Adr 0x100[15] l1a_win_pri_en = 1

Enables window prioritizing mode to limit TMB to 1 readout per L1A

Version 07/01/2010

- 1) Bug fix in alct*clct matching for a rare case when 2 CLCTs are exactly clct_window bx apart in time.

Caused 1st CLCT to be replaced by 2nd CLCT, sending 2 identical events to L1A pipeline.

- 2) New algorithm for L1A matching prevents multiple events from reading out for 1 L1A.

Original algorithm allowed multiple events to read out if they were within the L1A window.

A system downstream of TMB apparently fails to tolerate multiple readouts per L1A.

Adr 0x100[15] l1a_win_pri_en = 0 enables original multiple event readouts per L1A mode

l1a_win_pri_en = 1 enables a prioritizing mode that limits TMB to 1 readout per L1A

Current default l1a_win_pri_en = 0 to allow checking alct*clct matching logic.

Next firmware release will set the default to 1.

- 3) New counter 58 is inserted after counter 57, all subsequent counters shift up 1 channel number.

Counter 58 counts events lost from readout queue due to L1A window prioritizing that limits TMB to

1 event readout per L1A.

- 4) A buffer stalled-at-least-once bit has been added to Adr 0x9E[7] and Header38[14].

Indicates there was a least one buffer stall since the last resync.

- 5) Adr 0x44 rebuilt to expand CFEB pattern injectors to also assert L1A and ALCTs at an arbitrary time.

The 3 individual injector RAM select bits ren and wen have been replaced by 2-bit RAM addresses.

Injector RAM data width expanded from 16 to 18 bits to provide storage for 2 ALCTs and L1A.

- 6) Adr 0x32[3] alct_inj_ram_en = 1 enables ALCT pattern injector RAM

Adr 0x32[4] l1a_inj_ram_en = 1 enables L1A pattern injector RAM

7) Miniscope is now turned on by default: Adr 0x10C[0] mini_read_enable = 1.

Miniscope word count automatically inserted in readout stream by default Adr 0x10C[2]=1

New channel assignments, see Adr 0x10C section.

Version 05/14/2010

1) Add bx0 emulator enable to Adr 0x2A[15]. Power-up default is 0.

Generates bx0 that is ORed with ttc_bx0. For use in systems lacking a CCB.

2) Add clock_lock_lost_err_en to Adr 0x120[5] (shifts other bits left by 1).

Add clock_lock_lost_err_ff to Adr 0x120[14].

Add force_sync_err to Adr 0x120[15].

3) Redesign vme.v to use initial blocks to specify power-up state for VME registers instead of load pulse

Add explicit integer widths to VME address decoder case statement.

Replace constants passed as signals from top level module with defparam mechanism.

4) Remove clock_lock_lost from OR with bx0_sync_err in sequencer.v

Add clock_lock_lost term to sync_err_ff in sync_err_ctrl.v

Remove bx0_sync_err from sync_err_ff, add it as an independent OR with sync_err signal.

Fixes sync_err fails-to-clear bug:

Sync_err_ff clears on ttc_resync but bx0_sync_err takes n bx to clear.

TMB was synchronizing correctly on ttc_resync, but incorrectly latched sync_err=1.

5) Modify bx0 sync error counter[61] to count only when TMB is in trigger-run state.

Was counting sync errors before ttc_resync arrived, now only counts errors that occur after a resync.

A non-zero value in this counter indicates incorrect bxns in TMB readouts and LCTs.

6) Modify FMM state machine fmm_trig_stop signal to power up as a 1.

Was powering up as 0, then set to 1 after the 1st clock cycle.

Entered trigger-run state for 1bx but was ignored since pre-trigger logic is held off 5bx after power up

7) Fix tmb.v kill_clct logic for type C|D for 1 clct + 2 alct case where clct is on ME1A

Version 03/19/2010

1) Mod cfeb.v module busy hs delimiters for me1a me1b cscs to separate cfeb4 from cfebs0-3.

Prevents pattern finder from discarding 2nd CLCT at the me1a|me1b boundary.

Version 03/07/2010

1) Added requested mod that blocks bad cfeb distrips from both trigger path and data path.

2) Add bcb_read_enable to Adr72[15] [p44](#) to include blocked CFEB DiStrip list in the DMB readout stream:

Blocked bits include:

CFEB DiStrip bits turned off in the Hot Channel Mask,

CFEB DiStrip bits turned off by automatic bad-bits detection

Entire CFEBs turned off via mask_all

Set Adr72[[15]=1 to enable blocked bits readout.

Power up default is 0, which is backwards compatible with older versions of the readout stream.

3) Add bcb_read_enable to Header29[13]

4) Document CFEB blocked DiStrip readout format, [p98](#)

5) Bug fix for CLCT-only trigger mode

The 2nd CLCT in previous firmware versions had bxn=0 in the LCT sent to MPC when using the clct-only mode, and there was also no ALCT coincidence.

Version 02/10/2010

1) Add event_clear_vme to AdrAC[15] to clear aff, clct, and mpc VME read-back registers

2) Add active_feb list reversal for TypeB CSCs

Version 01/14/2010 CFEB bad di-strip bit detection

1) Header30[11:7] = cfeb_badbits_found[4:0] Bad distrip bits detected in cfebn[n]

Header30[12] = 0

2) New VME registers Adr 0x122 to 0x142

Adr 122 ADR_CFEB_BADBITS_CTRL, CFEB Bad Bits Control/Status

[04:00] RW cfeb_badbits_reset[4:0] Reset bad cfeb bits FFs for cfeb[n]

[09:05] RW cfeb_badbits_block[4:0] Block bad cfeb bits in cfeb[n]

[14:10] R cfeb_badbits_found[4:0] CFEB[n] has at least 1 bad bit

[15] R cfeb_badbits_blocked At least one CFEB has a bad bit that was blocked

Adr 124 ADR_CFEB_BADBITS_TIMER CFEB Bad Bits Check Interval

Sets number of bx a bit must be continuously high before being marked as bad.

Adr 126 ADR_CFEB0_BADBITS_LY01 CFEB0 Ly0,Ly1 Bad Bits List

Adr 128 ADR_CFEB0_BADBITS_LY23 CFEB0 Ly2,Ly3 Bad Bits List

Adr 12A ADR_CFEB0_BADBITS_LY45 CFEB0 Ly4,Ly5 Bad Bits List

Adr 12C ADR_CFEB1_BADBITS_LY01 CFEB1 Ly0,Ly1 Bad Bits List

Adr 12E ADR_CFEB1_BADBITS_LY23 CFEB1 Ly2,Ly3 Bad Bits List

Adr 130 ADR_CFEB1_BADBITS_LY45 CFEB1 Ly4,Ly5 Bad Bits List

Adr 132 ADR_CFEB2_BADBITS_LY01 CFEB2 Ly0,Ly1 Bad Bits List

Adr 134 ADR_CFEB2_BADBITS_LY23 CFEB2 Ly2,Ly3 Bad Bits List

Adr 136 ADR_CFEB2_BADBITS_LY45 CFEB2 Ly4,Ly5 Bad Bits List

Adr 138 ADR_CFEB3_BADBITS_LY01 CFEB3 Ly0,Ly1 Bad Bits List

Adr 13A ADR_CFEB3_BADBITS_LY23 CFEB3 Ly2,Ly3 Bad Bits List

Adr 13C ADR_CFEB3_BADBITS_LY45 CFEB3 Ly4,Ly5 Bad Bits List

Adr 13E ADR_CFEB4_BADBITS_LY01 CFEB4 Ly0,Ly1 Bad Bits List

Adr 140 ADR_CFEB4_BADBITS_LY23 CFEB4 Ly2,Ly3 Bad Bits List

Adr 142 ADR_CFEB4_BADBITS_LY45 CFEB4 Ly4,Ly5 Bad Bits List

Usage Notes:

1) Dead channel detection:

Detects CFEB channels that never fire

Set Adr122[09:5]=0x00 to turn off badbit blocking

Set Adr124[15:0]=0x0001 to set high-time threshold to 1 bx

Read dead channel list from Adrs126-142

2) Noisy channel detection:

Detects CFEB channels that have after-pulsing or frequent firing,
for instance, 3 consecutive triad starts)

Set Adr122[09:5]=0x00 to turn off badbit blocking

Set Adr124[15:0]=0x0007 to set high-time threshold to 7 bx

Read noisy channel list from Adrs126-142

3) Bad bit detection or blocking

Detects CFEB channels that are always high or high for an unreasonable length of time

Set Adr122[09:5]=0x1F to turn on badbit blocking (or set 0x00 for just monitoring)

Set Adr124[15:0]=0x0DEC to set high-time threshold to 3564 bx or something similar

Read bad channel list from Adrs126-142

Version 10/15/09 ALCT duplicate alct detection + Header r-type

1) Header05[10:9] r_type always == 1 on previous versions.

It should equal fifo_mode unless the event buffer is full.

2) Added ALCT structure error counter cnt[75] to count events where alct0==alct1.

3) AdrD0[5] Changed default to cnt_alct_debug=1 to enable ALCT data structure error counters.

N.B. The ALCT structure error counters are only 8 bits, and could reach full scale quickly.

So, AdrD0[02] cnt_stop_on_ovf should be 0, when setting cnt_alct_debug=1, otherwise all event counters will stop counting if there are excessive ALCT errors.

Version 09/21/09 Synchronization Error Control Register + bxn offset limit

Add limits for bxn_offset_pretrig and bxn_offset_11a

bxn_offset > lhc_cycle is converted to lhc_cycle-1

Add sync_err_ctrl register Adr 0x120

Version 09/08/09 Digital Phase Shifter Autostart

Add vsm_phaser_auto to AdrDA[11].

Default = 1, starts digital phase shifters after VME user PROM is read

Version 08/25/09 PosNeg sync FFs for ALCT and CFEBs

Same as 8/14/09 version but has ALCT and CFEB posneg sync stages enabled.

Switched to ISE 8.2sp3 because ISE 10.1sp3 could not complete PAR.

Documentation updates to conform firmware to c++ demo code:

Phaser register signal names now absorb hcycle and qcycle bits into 1 8-bit phase delay:

Adr10E: alct_rxd_delay[7:0] Delays latching data received from ALCT in 0.1ns steps

Adr110: alct_txd_delay[7:0] Delays data transmitted to ALCT in 0.1ns steps

Adr112-11A: cfeb[n]_rx_delay[7:0] Delays latching data received from CFEB[n] in 0.1ns steps

Modify interstage delay signals to make it clear they are integer bx delays:

Adr38: alct_txd_int_delay[3:0] Delay data transmitted to ALCT by integer bx

Adr11C-11E: cfeb[n]_rx_int_delay[3:0] Delay data received from CFEB[n] by integer bx

Has both ALCT and CFEB muonic timing.

Disabled cfeb posnegs and alct_rxd_posneg else compile fails. Alct_txd_posneg is OK.

Notes on ALCT and CFEB timing adjustments:

ALCT:

1) Select a Time of Flight delay:

Using DDD 2ns steps, ranging from 0 to 12, spanning 0 to 24ns

Based on distance from IP to “some point” on the CSC

Also compensate for tmb-to-alct cable propagation delay differences between CSCs

Write alct_tof_delay to DDD chip in Adr16[3:0]

2) Tune alct_rxd_delay to the good-data window center

Using Digital Phase Shifter 0.1ns steps, ranging from 0 to 255, spanning 0 to 25ns

Put ALCT into loopback mode to send a test pattern to TMB

Scan alct_rxd_delay 0-255 using Phaser0 Adr10E[15:8]

Scan alct_rxd_posneg 0-1 using Phaser0 Adr10E[15:8] (disabled in 8/14/09 firmware)

3) Tune alct_txd_delay to the good-data window center

Using Digital Phase Shifter 0.1ns steps, ranging from 0 to 255, spanning 0 to 25ns

Put ALCT into loopback mode to send a test pattern to TMB

Scan alct_txd_delay 0-255 using Phaser1 Adr110[15:8]

Scan alct_rxd_posneg 0-1 using Phaser1 Adr110[15:8] (not disabled in 8/14/09 firmware)

CFEBs:

1) Select a Time of Flight delay:

Using DDD 2ns steps, ranging from 0 to 12, spanning 0 to 24ns

Based on distance from IP to “some point” on the CSC

Also compensate for tmb-to-cfeb cable propagation delay differences between CSCs

Write cfeb_tof_delay to DDD chip in Adr18[11:8]

2) Tune cfeb[n] clock delays for simultaneous arrival at all 5 cfebs

Using DDD 2ns steps, ranging from 0 to 12, spanning 0 to 24ns

Delays might be set according to known cable propagation delays

Delays might be determined empirically by setting high comparator thresholds to make the analog signal time-over-threshold less than 25ns, then scanning DDD delay vs 6-hit efficiency.

Write cfeb[n] clock delays to DDD channels in Adr18[15:12] and Adr1A[15:0]

3) Tune cfeb_rxd_delay for cfeb[n] to the good-data window center

Using Digital Phase Shifter 0.1ns steps, ranging from 0 to 255, spanning 0 to 25ns

Generate CFEB test pulses or use muon tracks

Scan cfeb_rxd_delay 0-255 using Phaser2-6 Adr112-Adr11A bits[15:8]

Scan cfeb_rxd_posneg 0-1 using Phaser2-6 Adr112-Adr11A

4) Tune cfeb inter-stage integer delay for cfeb[n]

Set a delay 0-15bx so that triad bits from all 5 CFEBs arrive at TMB on the same bxn

Might be done by pulsing all 5 CFEBs simultaneously, then checking the CFEB

raw hits readout to see that triad start bits all appear in the same bxn.

Set cfeb[n] inter-stage delays in Adr11C-Adr11E

Version 07/13/09 Digital Phase shifters for CFEBs

Added 5 digital phase shifters for cfeb rxd delays: Adr112-Adr11A

Add 2 VME registers: Adr11C-Adr11E for CFEB interstage delays

Version 06/29/09 Digital Phase shifters for ALCT

Two digital phase shifters replace DDD delays for alct_txd_delay and alct_rxd_delay

Add VME registers Adr10E and Adr110 for digital phase shifters

Adr14[13,11,10] reverted to old format, removed phase shifter DCM locks

Adr30[15:13] removed posnegs, they now reside in Adr10E and Adr110, cfeb posneg is gone for now

Version 06/22/09 Muonic Timing for ALCT

Added muonic timing to float ALCT board in clock-space independently of good-data rxd|txd windows.

Changes to DLL lock register:

Adr14[10] lock_alct_rxd [these get undone in 6/29/09 version]

Adr14[11] lock_alct_txd

Adr 14[13] lock_cfeb_rxd

Changes to DDD delay and posneg registers:

Adr16[3:0] alct_tof_delay Shift entire ALCT in clock-space to compensate for muon time of flight

Adr16[7:4] alct_txd_delay Latches TMB-to-ALCT data in middle of transmit data window

Adr16[11:8] dmb_tx_delay Change default to 6

Adr18[3:0] alct_rxd_delay Latches ALCT-to-TMB data in middle of receive data window

Adr18[7:4] cfeb_rxd_delay Latches CFEB-to-TMB data in middle of receive data window

Adr18[11:8] cfeb_tof_delay Shift all CFEBs in clock-space to compensate for muon time of flight.

Adr30[8] alct_clock_en_use_ccb moved from [11]

Adr30[9] alct_clock_en_use_vme moved from [12]

Adr30[10] alct_muonic 1=ALCT muonic version instantiated, readonly

Adr30[11] cfeb_muonic 1=CFEB muonic version instantiated, readonly

Adr30[12] unassigned

[These changes get undone in 6/29/09 version:]

Adr30[13] cfeb_rxd_posneg Sets receive data posneg clock polarity (new signal)

Adr30[14] alct_txd_posneg Sets transmit data posneg clock polarity, (was alct_posneg)

Adr30[15] alct_rxd_posneg Sets receive data posneg clock polarity (new signal)

Changed 8bx constant delay in alct random number pipeline to be VME programmable

Added 2bx to compensate for muonic sync stages.

Default delay is now $8+2-1=9$ bx

Good spots for reference TMB+ALCT384 occur at pipedepth 4 when alct_sync_rxdata_pre=9

Adr104[15:12] = alct_sync_rxdata_pre[3:0], default=9

Changed Adr 0E[15:11] to connect dmb_tx_reserved[4:0] to dmb_tx[48:44]

Adr 0E[15:11] =dmb_tx_reserved[4:0], just set to 0 for now

Version 06/05/09

Re-structure dmb_tx[48:0] flip-flops to force IOB instantiation

No other changes

Added miniscope to monitor clct pretrigger processing and alct*clct matching.

Added miniscope VME register Adr 0x10C.

Rebuilt parity register Adr 0xFA to accept miniscope RAM parity.

Restructured DMB image RAM from 5 BRAMs down to 4 BRAMs to free up 1 RAM

Reduced ALCT raw hits storage RAM from 2048bx down to 1024bx to free up 1 RAM

Replaced Virtex-E era RPC de-mux and pipeline stages to minimize latency.

Added clct pre-trigger signal to RPC readout to DMB in a former always-zero bit.

Added data=address test mode to RPC storage RAM

Added 8bx constant delay in alct random number pipeline. Good spots at depth 12 before are now at 4.

Removed legacy alct signals from Adr 0x38,0x30 and Hdr 30[12:7] that are now used for ECC parity.

Added alct_ecc_err_blank to Adr 038[2] to blank alct data that has uncorrected ecc errors.

Added counter[6] to count alct data blanked due to uncorrected ecc errors

Adr 0x30: Removed Adr30[11:8] alct_reserved_out[3:0], as these bits now carry ecc parity.

Adr 0x38: Adr38 has been reorganized to make room for the new alct_ecc_err_blank signal

Moved alct_ecc_en to Adr38[1] n.b. this affects loop-back test software

Added alct_ecc_err_blank to Adr38[2] blanks alcts with uncorrected ecc errors.

Moved alct_sync_ecc_err to Adr38[4:3] n.b. this affects loop-back test software

Removed Adr38[2:1] seq_status[1:0]

Removed Adr38[4:3] seu_status[1:0]

Removed Adr38[8:5] reserved_out[3:0]

```
alct_stat_rd[0]      = alct_cfg_done;           // R   ALCT FPGA loaded
alct_stat_rd[1]      = alct_ecc_en;             // RW  Enable ALCT ECC decoder, else do no ECC correction
alct_stat_rd[2]      = alct_ecc_err_blank;      // RW  Blank alcts with uncorrected ecc errors
alct_stat_rd[4:3]    = alct_sync_ecc_err[1:0]; // R   ALCT sync mode ecc error syndrome
alct_stat_rd[11:5]   = alct_stat_wr[11:5];     // RW  Free
alct_stat_rd[15:12]  = alct_txd_delay[3:0];    // RW  ALCT data transmit delay, integer bx
```

Adr 0xFA: AdrFA has been reorganized to make room for the new miniscope RAM parity

perr_adr[] expanded from 3 to 4 bits.

Adr 0x10C: New Miniscope control register.

Adr 0xBC[14] Added rpc_tbins_test for RPC RAM data=address test mode

Adr 0xCA[9] Moved bx0_match to [10]

Added bx0_vpf_test to [9]

Hdr27[13] now ORs miniscope RAM parity errors with RPC RAM parity errors

Hdr19[14] vme_exists replaced by mini_read_enable

RPC readout format: unused tbin bit[11] was always 0, now has clct-pretrigger flag

Counter[06]: Inserted scnt[06]="ALCT: trigger path ECC>=2-bit error, ALCT discarded"

Shifts subsequent counters up by 1 address.

TMB readout format changed to include miniscope data and markers when mini_read_enable=1.

By default, inserts B07 marker, 22 scope words, then E07 marker after RPC data.

ALCT legacy cable signals that are now ecc parity updated in

Table 18: J5 ALCT Cable1 Connector [J10 on ALCT board]

Table 19: J6 ALCT Cable2 Connector [J11 on ALCT board]

Versions 04/07/2009 - 04/14/09

Added TMB-to-ALCT sync-stage and inter-stage in alct.v module.

Improves alct_rx_clock windows, and allows a 1/2-cycle shift
in alct_rx_clock at inter-stage, but adds 2bx to output signals.

Add Adr 30[14] alct_posneg

Modified UCF to constrain ALCT inter-stage flip-flops to FPGA slice locations near ALCT IOBs

Compiled 1 version with ALCT 80 MHz IOBs set to Slew=Fast | Drive=12

Another version has ALCT 80 MHz IOBs set to LVDCI_33 (Digitally Controlled Impedance, 50Ω)

Added TMB-to-ALCT 80MHz diagram to this doc

Version 03/16/2009

New Features:

Error Correcting Code to ALCT-to-TMB trigger data path, using reserved rx signals

Error Correcting Code to TMB-to-ALCT TTC command path, using reserved tx signals

Separate bxn counter and offset for L1A

New event counters + re-numbered ALCT-counter-group 0-11 [see counter register adr 0x000]

(see AdrD0 [p61](#) for details)

3 for ECC rx data

3 for ECC tx data

5 for individual CFEB pre-triggers

1 for alct_bx0

Register Changes:

Adr 016 change delay_ch0[3:0] alct_tx_clock default to 11 for use with reference ALCT

Adr 076 rename from adr_seq_offset to adr_seq_offset0

Adr 076 rename bxn_offset[11:0] to bxn_offset_pretrig[11:0]

Adr 0D0 increase cnt_select[6:0] by 1 bit to address more event counters

Adr 0D0 move perr_reset from AdrD0[15] to AdrFA[6]

Adr 10A new register adr_seq_offset1

Adr 10A add bxn_offset_pretrig[11:0], which is a separate bxn offset for the new L1A bxn counter

Adr038[10:9] new signal: alct_sync_ecc_err[1:0] is ALCT sync-mode ECC error code, readonly

Adr038[11] new signal: alct_ecc_en is ALCT ECC trigger data correction enable with default=1

N.B. setting alct_ecc_en =0 stops ALCT trigger data correction, but does not affect ECC counters

Header Changes:

Header30[6:5] now contains alct_ecc_err[1:0]

ALCT Cable Signal Changes for ECC

Old	New	Comment
reserved_in[0]	parity_in[0]	ECC parity [5:0] for TMB-to-ALCT

Version 02/05/2009

Added ALCT-TMB sync mode loop-back test logic to alct.v module.

Mod Adr F2: Change compiler ID field to accommodate extra digit for ISE 10.1I

Add Adr104, Adr106, Adr108 for ALCT sync-mode data

Version 01/13/2009

Rename ALCT cable 2 pair 15 from reserved_in4 to seq_cmd3

Adr 30: alct_cfg: rename Adr30[7] to seq_cmd3, replaces reserved_in4

Version 12/10/2008

Add L1A-only readout mode with full header and raw hits

Add L1A lookback offset in new VME register Adr 0x100

Add sequencer debug signals to new VME register Adr 0x102

Replaced parity errors Adr 0x0FA with sub-adr multiplexing

Add 35-bit RAM parity error array to Adr 0x0FA

Version 11/18/2008

Replaced L1A data storage logic:

Moved L1A data from header RAM to fence queue RAM

Allows L1A-only TMB readout mode to have valid data in short-header (i.e. bxn at L1A arrival)

To enable L1A-only TMB readout

[1] fifo_mode=3 sets short header

[2] l1a_allow_notmb=1 allows readout when tmb didn't trigger for that L1A

[3] turn off TMB pre-triggers (set mask_all=0 or halt pre-trigger machine)

[4] send L1A via TTC....all ~500 TMBs should send short header to DDU

Inverted raw hits RAM parity.

Now parity bit=1 if RAM data[7:0]=8'b00000000

Modified CFEB and RPC raw hits RAMB16s to be read-first instead of write-first.

Guarantees parity data on port B is valid before writing new data to port A.

AdrFE[2] BXN latched at last L1A

New Event Counters

Inserted 2 new counters after counter[47]

counter[48]= Sync error, bxn!=offset at bx0 arrival or bx0 did not arrive at bxn==offset

counter[49]= Raw hits RAM parity error, possible radiation SEU

Note on enabling internal scope readout to DMB/DDU

Adr98 = 0x108B

Adr9A = 0x0000

AdrCE = 0x0000

Version 09/30/2008

AdrD4[2] add jsm_sel to select old/new alct user prom format.

This is a write-only bit, it reads back the value of vsm_jtag_auto

New Internal Scope Logic:

Allows scope channel data to be inserted in DMB readout stream

All scope channel signal assignments have been replaced

Adr98 Replaced with new internal scope signals

Adr9A Replaced with new internal scope signals

To enable scope data in DMB readout, set

scp_ch_trig_en=1

scp_runstop=1

scp_force_trig=0

scp_auto=1 (also appears in Header19[13])

scp_tbins=4 (may be 0 to 7, number of scope tbins = 64*(scp_tbins+1), thus spanning 64 to 512)

scp_nowrite=0

Rename Event Counters to better describe their functions

counter[22]= TMB matching discarded an ALCT pair (all alcts in the pair were discarded)

counter[23]= TMB matching discarded a CLCT pair (all clcts in the pair were discarded)

New Event Counters

Inserted 2 new counters after counter[23]

counter[24]= TMB matching discarded CLCT0 from ME1A

counter[25]= TMB matching discarded CLCT1 from ME1A

Shifts all subsequent counter addresses up by 2

Header Updates:

header08_[12]	r_tmb_clct0_discard;	TMB discarded clct0 from ME1A
header08_[13]	r_tmb_clct1_discard;	TMB discarded clct1 from ME1A

Version 09/12/2008

Added tmb_trig_pulse to header40[14]

Added tmb_trig_keep to header41[9]

Added tmb_non_trig_keep to header41[10]

Version 09/05/2008

Add blocking of LCTs to MPC for ME1A

Version 08/28/2008

Logic modifications:

Firmware compile type codes introduced, replaces programmable stagger and reversal

Added hs reversal for ME1A and ME1B and full hs reversal for non-ME1A/B CSCs

Added blocking for ME1A to MPC, but is not yet functional in this release

Added 2 state machines to detect and count TTC lock loss signals from CCB

Adr 2E[9]: Add ccb_ttrrx_ready TTC ready signal from CCB

Adr 2E[10]: Add ccb_qpll_locked Lock signal from CCB

Adr 2E changed register symbolic name from ADR_CCB_STAT to ADR_CCB_STAT0

Adr FA[15:0] Add new register ADR_PARITY contains parity SEU error status

Adr FC[15:0] Add new register ADR_CCB_STAT1 contains TTC lock status from lock state machines

Rename event counter [5] "Pre-trigger was on any cfeb"

Inserted 2 new event counters after counter[5], shifts all other counter addresses up 2

[6] Pre-trigger was on ME1A cfeb4 only

[7] Pre-trigger was on ME1B cfebs0-3 only

Add 2 new event counters after counter[57],

[58] CCB: TTCrx lock lost

[59] CCB: qPLL lock lost

Add new register AdrFC for CCB lock detection

AdrFC[00] ccb_ttcx_lock_never TTCrx lock never achieved

AdrFC [01] ccb_ttcx_lost_ever TTCrx lock was lost at least once

AdrFC [02] ccb_qpll_lock_never QPLL lock never achieved

AdrFC [03] ccb_qpll_lost_ever QPLL lock was lost at least once

Extended trigger source vector in VME and Header:

Adr7C[9] me1a_only_pretrig

Adr7C[10] me1b_only_pretrig

Hdr40[12]=r_trig_source_vec[9]

Hdr40[13]=r_trig_source_vec[10]

Introduced Firmware Compile Type Codes

A=Normal CSC

B=Reversed CSC

C=Normal ME1B, Reversed ME1A

D=Reversed ME1B, Normal ME1A

Extended ½-strip reversal and ME1A/B signals to Adr CC

Adr CC[05] csc_me1ab 1= CSC is ME1A or ME1B. 0=normal CSC

Adr CC[06] stagger_hs_csc 1=Staggered Adr CSC, 0=non-staggered

Adr CC[07] reverse_hs_csc 1=Reversed staggered CSC, non-me1

Adr CC[08] reverse_hs_me1a 1=reversed me1a hstrips

Adr CC[09] reverse_hs_me1b 1=reversed me1b hstrips

Adr CC[15:12] csc_type[3:0] Firmware compile type A, B,C or D

Added ½-strip reversal signals to Header

Header does not contain csc_type explicitly, but csc_type can be inferred from reversal signals in Hdr39[14:12] and Hdr20[14]

Hdr20[14] stagger_hs_csc CSC Staggering ON

Hdr39[12] reverse_hs_csc 1=Reverse staggered CSC, non-me1
Hdr39[13] reverse_hs_me1a 1=ME1A hstrip order reversed
Hdr39[14] reverse_hs_me1b 1=ME1B hstrip order reversed

Added ME1A LCT blocking to MPC [not yet functional in this release]

Adr CC[03] mpc_me1a_block Block ME1A LCTs from MPC, still queue for readout

Adr CC[04] cnt_non_me1ab_en Allow clct pretrig counters count non me1ab events

End of 8/28/2008 mods

Version 08/12/2008

Adr38[15:12]: add alct_txd_delay[3:0] to delay alct tx data, delay=0 by default has same timing as previous firmware versions.

Adr CA[9]: add bx0_match

Hdr30[14]: add bx0_match

Version 08/04/2008

Adr F6[6]: add clct_sep_ram_sel_ab to select A or B separation RAM data readback

Version 08/01/2008

Adr F4[1]: stagger_csc is now read-only, set at firmware compile time

Header36: r_nrpcs_read in header now gated with rpc_read_enable.
now indicates 0 rpcs when rpc readout is disabled

Version 07/15/2008

Added ability to readout non-triggering events

Header41[0] = VME settings for tmb_allow_alct, for trigger and readout

Header41[1] = VME settings for tmb_allow_clct, for trigger and readout

Header41[2] = VME settings for tmb_allow_match, for trigger and readout

Header41[3] = VME settings for tmb_allow_alct_ro, for non-triggering readout

Header41[4] = VME settings for tmb_allow_clct_ro, for non-triggering readout

Header41[5] = VME settings for tmb_allow_match_ro, for non-triggering readout

Header41[6] = alct-only non-triggering event

Header41[7] = clct-only non-triggering event

Header41[8] = alct*clct match non-triggering event

Header41[9] = This event is a non-triggering readout

New Event counter at subadr[19] counts non-triggering events queued for readout

Shifts all subsequent counter addresses up 1

New VME register adrCC:

AdrCC[0] = tmb_allow_alct_ro allow alct-only non-triggering event readout

AdrCC[1] = tmb_allow_clct_ro allow clct-only non-triggering event readout

AdrCC[2] = tmb_allow_match_ro allow alct*clct-match non-triggering event readout

Version 07/09/2008

Replaced entire ALCT UserPROM JTAG State Machine

New compressed data format: see JTAG PROM-1 section [p93](#)

Adr 70: Move dmb_thresh[2:0] from adr F4[8:6] to adr70[9:7]

Adr 70: Rename dmb_thresh to dmb_thresh_pretrig

Adr 70: Rename hit_thresh to hit_thresh_pretrig

Adr 70: Rename nph_thresh to hit_thresh_postdrift

Adr F0: Rename lyr_thresh[2:0] to lyr_thresh_pretrig[2:0]

Adr F4: Remove dmb_thresh from F4[8:6]

Adr F4: Add new signal pid_thresh_postdrift[3:0] to F4[9:6]

Adr F4: Move adjcfeb_dist from F4[14:9] to F4[15:10]

Adr F4: Rename pid_thresh to pid_thresh_pretrig

Add adr D8[12] jsm_tckcnt_ok JTAG PROM TCKs sent matches TCKs in trailer frame

Add adr D8[13] jsm_end_ok JTAG PROM FF end marker found where expected

Add adr D8[14] jsm_header_ok JTAG PROM BA begin marker found where expected

Add adr D8[15] jsm_chain_ok JTAG PROM Chain Block marker found where expected

Add adr DE[14:13] jtag_sm_vec[1:0] JSM JTAG signal state machine vector

Add adr E0[11:8] jsm_prom_sm_vec[3:0] JSM PROM state machine vector

Add adr E0[14:12] jsm_format_sm_vec[3:0] JSM Data format state machine vector

Add adr EA[15] jsm_tckcnt_ok JSM tckcnt added to board status

Header20: remove header20_[12:10] lyr_thresh[2:0]

Header20 remove header20_[13] layer_trig_en

Header20 add header20_[13:10] pid_thresh_postdrift[3:0]

Header41: add header41_[13:11] lyr_thresh_pretrig[2:0]

Header41 add header41_[14] layer_trig_en

New Counters:

Inserted 2 counters after counter at SubAdr[8]

SubAdr[9]CLCT: CLCT0 passed hit thresh but failed pid thresh after drift

SubAdr[10]CLCT: CLCT0 passed hit thresh but failed pid thresh after drift

Shifts all other counter addresses up by 2, i.e. old counter at SubAdr[9] moved to [11]

Change CLCT Processing Algorithm at bx11 to also require $\text{pid} \geq \text{pid_thresh_postdrift}$

Version 06/03/2008

Modifies global_reset and ttc_resync behavior

Adds ability to send active feb flag to DMB at tmb alct*clct matching, retains ability to send at pre-trig

Overlays ALCT rx data with normal scope channels to aid alct debugging

- (1) Remove Adr A8[12] alct_raw_sync, wasn't being used
- (2) Add temporary alct structure error counters [48]-[52]
- (3) Add Adr D0[6] cnt_clear_on_resync clears VME counters [0]-[40] on ttc_resync, default=0
- (4) Add Adr D0[7] hdr_clear_on_resync clears header counters [41]-[47] on ttc_resync, default=1
- (5) Update MPC frame format doc (reflects changes to 5/12/08 firmware)
- (6) Added a startup state to the readout state machine to wait 1bx for buf_q_empty to update after a reset (prevents machine from resuming a readout that was in progress at the time of a ttc_resync)
- (7) Add perr_reset (one-shot) to Adr D0[15], removed ttc_resync perr reset logic
- (8) Block ttc_resync from clearing resync event counter, requires vme-clear

(9) ADr2A[3] change ccb_status_oe default from 1 to 0, turns off backplane drivers to ccb

Added write-only bits to parallel non-decoded ccb commands:

Adr2A [12] vme_eventres Event counter reset || ccb_eventres

Adr2A[13] vme_bcntres Bunch crossing reset || ccb_bcntres

Adr2A14] vme_bx0 Bx0 signal || ccb_bx0

(10) ADr28[12] now contains global_reset_en=1 to enable resets on DLL lock-lost

(11) Header08[14] now contains clock_lock_lost

(12) ADrAC[14]=active_feb_src, 0=pretrig, 1=at tmb matching

(13) ADrB0[7:3]=clctf[4:0] active cfeb list at tmb matching

(14) Header23[4:0] active feb list is stored either at pretrig time or tmb match, depending active_feb_src

(15) Header23[14] now contains active_feb_src bit

(16) Header29[14] now contains hs_layer_trig (moved from header23[14])

(17) ADrCE[15]=scp_ch_overlay, 0=normal scope channels, 1=use debugging channel overlay

Current overlay assignments:

scp_ch[71:0] = normal

scp_ch[128:72] = scp_alct_rx[55:0]

assign scp_alct_rx[0]	= alct_active_feb_flag;
assign scp_alct_rx[1]	= alct_first_valid;
assign scp_alct_rx[2]	= alct_first_amu;
assign scp_alct_rx[4:3]	= alct_first_quality[1:0];
assign scp_alct_rx[11:5]	= alct_first_key[6:0];
assign scp_alct_rx[12]	= alct_second_valid;
assign scp_alct_rx[13]	= alct_second_amu;
assign scp_alct_rx[15:14]	= alct_second_quality[1:0];
assign scp_alct_rx[22:16]	= alct_second_key[6:0];
assign scp_alct_rx[27:23]	= alct_bxn[4:0];
assign scp_alct_rx[28]	= #alct_wr_fifo;
assign scp_alct_rx[29]	= alct_first_frame;
assign scp_alct_rx[43:30]	= alct_daq_data[13:0];
assign scp_alct_rx[44]	= alct_lct_special;
assign scp_alct_rx[45]	= alct_ddu_special;
assign scp_alct_rx[46]	= alct_last_frame;
assign scp_alct_rx[48:47]	= alct_seq_status[1:0];
assign scp_alct_rx[50:49]	= alct_seu_status[1:0];
assign scp_alct_rx[54:51]	= alct_reserved_out[3:0];

```
assign      scp_alct_rx[55]      = alct_cfg_done;
```

Version 05/23/2008

- (1) Adr B0[15:14] Add clock_lock_lost and sync_er

Version 05/12/2008

- (1) mpc alct_bx0 and clct_bx0 signals now bypass mpc_tx_delay
- (2) Note: Adr86[13] default=0 uses ttc_bx0, set it to 1 to use local bxn counter instead
Adr86[14] default=0 enables bx0 to mpc continuously, 1 blanks mpc frames unless triggering
- (3) Adr CA[8] default changed to 1 to enable using reserved[3] signal from alct as alct_bx0
- (4) Adr90[15:14] now contains bx0 injector one-shots

Version 05/01/2008

- (1) All scope channels replaced, see Scope Channel Assignments [p50](#)
- (2) Header11 CLCT counter was behind by 1 event, fixed.
- (3) Header22 Trigger source for alct*clct matching is set even if match mode is off, fixed.
- (4) Header28/29/30 ALCT data was latched n-bx early, leaving empty frames, fixed.

Version 04/29/2008

- (1) ALCT signal reserved_out[3] (alct-to-tmb) is now alct_bx0
- (2) Adr 68[02] renamed match_pat_trig_en to alct_match_trig_en
- (3) Adr AC[5] hdr_wr_continuous should be set to 0 unless using l1a_allow_notmb=1 mode
- (4) Adr AC[14] removed allow_pretrig_noflush bit
- (5) Adr AE[11:0] sequencer state shortened from [14:0]
- (6) Adr B2[7:4] Renamed clct_width to clct_window
- (7) Adr BA[15:8] Now contains rpc bxn differences moved from Adr C4

(8) Adr C4 renamed to ADR_RPC_TBINS

Adr C4 added rpc tbins, tbins before pre-trigger, and rpc_decouple [=0 to copy cfeb tbins]

(9) Adr CA[] new name ADR_BX0_DELAY, all new signals for bx0_delay and bx0 source

(10) Adr D0[8] now contains counter lower-half / upper-half mux bit cnt_adr_lsb

Adr D0[14:9] now contains counter sub-address cnt_adr[5:0]

Adr D0 Event counters replaced with new names and new sub-address channel numbers

(11) Adr F0[15:8] = clct_throttle[7:0], default=0

(12) Adr F4[0]=clct_blanking=1 (new default), prevented from setting to 0 unless l1a_allow_notmb=1 or tmb_alct_only=1

(13) Header21[14:11] Renamed clct_width to clct_window

(14) Header36 replaced to display rpc_tbins and rpc_pretrig, affects event-size calculation software, rpc_exists[1:0] deleted.

(15) Header41 now contains the enabled TMB matching modes

Version 02/5/2008

Added parity checking to cfeb and rpc raw hits RAMs for SEU detection

Added parity error bits to header27

Add drift_delay to header29

Add alct pretrig window position to header28

Version 01/24/2008

Replaced entire L1A logic.

Replaced 8-buffer system with 2048 buffers.

Replaced readout stack with event queue.

Replaced lct_quality.

Several VME addresses have changed:

(1) Adr AC[4] is now wr_buf_autocl (formerly clct_turbo).

Adr AC[5] 1=allow continuous header buffer writing for invalid triggers

Previously an unused bit. Default remains 0 until new trigger logic is ready.

(2) New buffer status signals now occupy Adrs 9E,A0,A2,A4,A6.

ADR_BUF_STAT0=9E

ADR_BUF_STAT1=A0

ADR_BUF_STAT2=A2

ADR_BUF_STAT3=A4

ADR_BUF_STAT4=A6

Old Adr A2 (alctfifo1) moved to A8 (old A8 was empty)

Old Adr A4 (alctfifo2) moved to AA (old AA was empty)

Old Adr A6[5:0] adjcfcb_dist[5:0] moved to F4[14:9]

(3) Adr 72[13] is now fifo_no_raw_hits [1=do not wait to store raw hits. A no_daq mode.]

(4) Adr 74[15:13] is now l1a_internal_dly[2:0] (mostly for use by the simulator)

(5) Adr AE[14:11] signal names changed for buffer status

(6) Adrs B0, 78, 7A contain new CLCT internal format

(7) Header04[13] is now buf_q_ovf_err, formerly stack_ovf_latch

Header05[14] is now buf_stalled, formerly buf_full

Header37,38,39, 40 changed for buffer status [some assignments are probably temporary]

Header25,26,27 contain new CLCT internal format

(8) Scope channels replaced

(9) Counters 1A, 1C, 1E changed, now count debug signal presence instead of time-outs

Version 10/11/2007

(1) CLCT raw hits CRC now stops at the frame before the DE0F marker due to DDU's failure to include the marker.

(2) ALCT raw hits CRC check stops at the frame before the DE0D marker, same reason.

Version 9/14/2007

(1) Header bug fixes in readout counter and lct-duplication flags

(2) New no-alct VME counter, channel 32/33, shifts subsequent channel numbers up 2

(3) ALCT DDR transmitter constraints minimize routing delays between alct_rx_clock and main clock.

Version 9/10/2007

(1) New raw hits readout header+trailer format replaces all previous header field assignments.

(2) New VME counters, channels 32 to 4C.

Version 7/10/2007

(1) Increase tmb.v-sequencer.v handshake time-out from 8bx to 15bx to prevent late alct*clct matches from being counted as discarded events when using higher than normal clct_width values.

(2) Modify pre-trigger state machine to wait for alct*clct matching (or clct-only) before re-arming for the next pre-trigger event to prevent writing current event to wrong header buffer when using higher than normal clct_width values.

(3) Modify pre-trigger state machine to wait for active_feb signal to return to 0 before the next pre-trigger event to avoid re-triggering on same event when using longer than normal triad_persistence.

Version 7/05/2007

(1) Pattern-finder key layer shifted from ly3 back to ly2.

Ly3 pattern templates were flipped top-to-bottom to shift key layer to ly2, and flipped left-to-right to preserve bend direction.

(2) ADR A6 adjcfcb_dist[5:0] is now 6-bits instead of 5 to allow dist=32 to span a full cfcb, default value remains 5hs.

(3) ADR F4 dmb_thresh[3:0] default is now 4 to reduce spurious active feb signals to DMB

(4) CLCT Processing Algorithm description updated for current patterns

Version 6/21/2007

(1) Adr D4 bit 11 now contains wr_usr_jtag_dis.

When wr_usr_jtag_dis=1, write access to register adr_usr_jtag is blocked.

This allows parallel writes to jtag chains for selected alcts.

Adr 10 bit 14 indicates the state of wr_usr_jtag_dis.

(2) Adrs A0, A8, AA, CA, CC are now obsolete.

Their FFs have been removed, and they read back 0000h.

(3) Adr A6 now contains adjcfeb[4:0] with a default value of 5 hstrips.

This replaces the function of mask registers A6, A8, and AA.

If there is n hstrip key on hs 0,1,2,3,4 on CFEBn, with hits \geq hit_thresh_pretrig, then CFEBn-1 will be marked in the active_feb list for DMB readout.

If there is a hstrip key on hs 31,30,29,28,27 on CFEBn, with hits \geq hit_thresh_pretrig, then CFEBn+1 will be marked in the active_feb list for DMB readout.

(4) Adr 6C, layer_trig_dly has been removed.

(5) Header05[12] now contains trigger source vector bit [8] (layer trigger)

Header05[13] hsds bit removed.

(6) Header16[14:11] now contains pid_thresh[3:0] instead of ds_thresh[2:0].

(7) References to hs_thresh[2:0] have been changed to hit_thresh_pretrig[2:0].

References to ds_thresh[2:0] have been removed.

(8) Adr 70, ds_thresh[2:0] has been removed.

(9) Pattern ID numbers have been shifted from 0-to-8 to 2-to-10.

Pattern ID=1 now indicates a layer-trigger event.

Pattern ID=0 now indicates no pattern matches found.

(10) Adr F4, clct_blanking=1 is the new default value
